ABSTRACT

This document collects the 12 monthly issues of Volume 30 of "Exceptional Parent," a magazine focused on practical advice for parents of children with disabilities. Most issues include a focus topic as well as articles on other issues, columns, reviews, and letters. The issues focus on the following areas: (1) an extensive resource guide; (2) early childhood; (3) promising medical research; (4) mobility; (5) recreation, sports, and play; (6) technology in education and daily living; (7) adolescence as a time of change, challenge, and transition; (8) health care; (9) education; (10) toys; (11) technology; and (12) family, friends, and the community. The only bad question about carnitine deficiency is the one you don't ask.

Carnitine deficiency may affect as many as 375,000 children in the U.S. Unfortunately, it's hard to detect and often overlooked.

Carnitine plays a vital role in the production of energy. And when a child suffers from carnitine deficiency, he or she may have symptoms as subtle as developmental delay, frequent illness, poor muscle tone or slow weight gain. If Carnitor® can help your child, results may be dramatic.

Carnitor® is the only treatment for carnitine deficiency.

So ask your child's doctor about Carnitor® and contact us for more information at 1-800-447-0169.

levocarnitine

IV · TABLETS · ORAL SOLUTION

Adverse events reported with Carnitor® use include nausea, vomiting, body odor, gastritis, and seizures. There are no reported contraindications or warnings. Please refer to the attached brief summary of prescribing information.

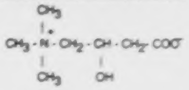
Carnitor®
levocarnitine

IV · TABLETS · ORAL SOLUTION

Description
CARNITOR® (Levocarnitine) is (R)-3-carboxy-2-hydroxy-N,N,N-trimethyl-1-propanaminium hydroxide, inner salt. Levocarnitine is a carrier molecule in the transport of long-chain fatty acids across the inner mitochondrial membrane. As a bulk drug substance it is a white powder with a melting point of 196-197°C and is readily soluble in water, hot alcohol, and insoluble in acetone. The pH of a solution (1 in 20) is between 6-8 and its pKa value is 3.8. Its chemical structure is:



$$CH_3-\overset{\overset{CH_3}{|}}{\underset{\underset{CH_3}{|}}{N^{+}}}-CH_2-\underset{\underset{OH}{|}}{CH}-CH_2-COO^{-}$$

Empirical Formula: $C_7H_{15}NO_3$
Molecular Weight: 161.20

Each CARNITOR® (Levocarnitine) Tablet contains 330 mg of levocarnitine and the inactive ingredients magnesium stearate, microcrystalline cellulose and povidone.

Each 118 mL container of the CARNITOR® (Levocarnitine) Oral Solution contains 1 g of levocarnitine/10 mL. Also contains: Artificial Cherry Flavor, D,L-Malic Acid, Purified Water, Sucrose Syrup. Methylparaben NF and Propylparaben NF are added as preservatives. The pH is approximately 5.

CARNITOR® (Levocarnitine) Injection is a sterile aqueous solution containing 1 gram of levocarnitine per 5 mL ampoule and 500 mg of levocarnitine per 2.5 mL ampoule. The pH is adjusted to 6.0 - 6.5 with hydrochloric acid.

Clinical pharmacology
CARNITOR® (Levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.[1-6]

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency.[7,8] Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted. Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine (less than 20 µmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

Bioavailability/Pharmacokinetics
In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (Levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® (Injection) intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.[9]

Metabolism and excretion
Five normal adult male volunteers, administered a dose of $[^3H$-methyl$]$-L-carnitine following 15 days of a high carnitine diet and additional carnitine supplement, excreted 58% to 65% of administered radioactive dose in 5 to 11 days in the urine and feces. Maximum concentration of $[^3H$-methyl$]$-L-carnitine in serum occurred from 2.0 to 4.5 hr after drug administration. Major metabolites found were trimethylamine N-oxide, primarily in urine (8% to 49% of the administered dose) and $[^3H]$-g-butyrobetaine, primarily in feces (0.44% to 45% of the administered dose). Urinary excretion of carnitine was 4% to 8% of the dose. Fecal excretion of total carnitine was less than 1% of total carnitine excretion.[10]

After attainment of steady state following 4 days of oral administration of L-carnitine with CARNITOR® Tablets (1980 mg q12h) or Oral Solution (2000 mg q12h) to 15 healthy male volunteers, urinary excretion of L-carnitine was a mean of 2107 and 2339 µmoles, respectively, equivalent to 8.6% and 9.4%, respectively, of the orally administered doses (uncorrected for endogenous urinary excretion). After a single intravenous dose (20 mg/kg) prior to multiple oral doses, urinary excretion of L-carnitine was 6974 µmoles, equivalent to 75.6% of the intravenously administered dose (uncorrected for endogenous urinary excretion).

Indications and usage
CARNITOR® (Levocarnitine) Tablets and Oral Solution are indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient. CARNITOR® (Levocarnitine) Tablets and Oral Solution are also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CARNITOR® (Levocarnitine) Injection is indicated for the acute and chronic treatment of patients with an inborn error of metabolism that results in secondary carnitine deficiency.

Contraindications
None known.

Warnings
None.

Precautions
General
CARNITOR® (Levocarnitine) Oral Solution is for oral/internal use only.
Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (Levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility
Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (Levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

Pregnancy
Pregnancy Category B
Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

Nursing Mothers
It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Pediatric use
See Dosage and administration.

Adverse reactions
CARNITOR® (Levocarnitine) Oral Solution and Tablets.
Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (Levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

CARNITOR® (Levocarnitine) Injection.
Transient nausea and vomiting have been observed. Less frequent adverse reactions are body odor, nausea, and gastritis. An incidence for these reactions is difficult to estimate due to the confounding effects of the underlying pathology.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

Overdosage
There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

Dosage and administration
CARNITOR® (Levocarnitine) Tablets.
Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (Levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**
Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (Levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day, which is equivalent to 0.5 mL/kg/day CARNITOR® (Levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (Levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

CARNITOR® (Levocarnitine) Injection.
CARNITOR® Injection is administered intravenously. The recommended dose is 50 mg/kg given as a slow 2-3 minute bolus injection or by infusion. Often a loading dose is given in patients with severe metabolic crisis followed by an equivalent dose over the following 24 hours. It should be administered q3h or q4h, and never less than q6h either by infusion or by intravenous injection. All subsequent daily doses are recommended to be in the range of 50 mg/kg or as therapy may require. The highest dose administered has been 300 mg/kg.

It is recommended that a plasma carnitine level be obtained prior to beginning this parenteral therapy. Weekly and monthly monitoring is recommended as well. This monitoring should include blood chemistries, vital signs, plasma carnitine concentrations (the plasma free carnitine level should be between 35 and 60 micromoles/L) and overall clinical condition.

Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit.

Compatibility and Stability
Carnitor® Injection is compatible and stable when mixed in parenteral solutions of Sodium Chloride 0.9% or Lactated Ringer's in concentrations ranging from 250 mg/500 mL (0.5 mg/mL) to 4200 mg/500 mL (8.0 mg/mL) and stored at room temperature (25°C) for up to 24 hours in PVC plastic bags.

How supplied
CARNITOR® (Levocarnitine) Tablets are supplied as 330 mg tablets embossed with "CARNITOR ST" in individual blisters, packaged in boxes of 90 (NDC 54482-144-07). Store at controlled room temperature (25°C). See USP.

CARNITOR® (Levocarnitine) Oral Solution is supplied in 118 mL (4 FL. OZ.) multiple-unit plastic containers. The multiple-unit containers are packaged 24 per case (NDC 54482-145-08). Store at controlled room temperature (25°C). See USP.

CARNITOR® (Levocarnitine) Oral Solution is manufactured for Sigma-tau Pharmaceuticals, Inc. By: Alpharma USPD, Inc. Baltimore, MD 21244-2654 and/or Hi-Tech Pharmacal Co., Inc. Amityville, NY 11701.

CARNITOR® (Levocarnitine) Injection, 200 mg per 1 mL, is available in 5 mL single dose ampoules packaged 5 ampoules per carton (NDC 54482-146-09) and in 2.5 mL single dose ampoules packaged 5 ampoules per carton (NDC 54482-146-10). Made in Italy.

Store ampoules at controlled room temperature (25°C). See USP. Store in carton until their use to protect from light. Discard unused portion of an opened ampoule, as they contain no preservative.

Rx only

Patients need a helping hand.

Patients shouldn't have to worry about where their next medication will come from or if they'll get the right treatment.

At Sigma-Tau Pharmaceuticals, Inc., we do the worrying for them.

We're working to ensure that no patient is overlooked, even those with difficult-to-diagnose disorders like carnitine deficiency.

And doctors should have our support.

In the past 50 years, 500 metabolic disorders have been discovered.

It's no wonder that doctors need all the support they can get to keep up with the latest research.

We're strengthening our partnership with healthcare professionals to provide resources that can help answer difficult questions about metabolic disorders and other commonly misdiagnosed diseases.

A New Century Dawns

As I write these words, the last days of the old year, and old century, are dwindling away. It is at this time everyone has the urge to take stock and look back over the past. While it is always important to remember the past, knowing how to find your way into the future is just as vital, and never more so than now! While putting together this year's Resource Guide, we tried to keep in mind both of these perspectives.

This year we have included some of the same information that has proven helpful to our readers in their role as partners in all the decisions made for their child as well as adding some new features.

We have updated all our listings: from accessibility in amusement parks nationwide, to national and international resources for specific disabilities, as well as those for the various federal and state agencies overseeing the programs that are the right of every child with a disability. Some new features include a selection of Colleges and Universities for Students with Learning Disabilities and a listing of hospitals from the National Association of Children's Hospitals and Related Institutions (NACHRI), advocacy resources, and rating managed care organizations (MCOs).

Advocacy

Families often have some difficulty in negotiating the various service providers and in protecting their child's rights. Unfortunately, an alarming number of city and state agencies often dare families to demand their due, causing the family to face lengthy and costly legal battles when their child needs services immediately. This year we have added information on two advocacy groups that can help you to manage these dilemmas: the National Association of Protection and Advocacy Systems (NAPAS) and the Developmental Disability Councils, which are present in most states.

Health Services-MCOs

The most important change in the delivery of medical services is the development of managed care organizations (MCOs). They are now the major vehicles for covering health costs, though consumers usually have no say in choosing them. As a result, MCOs have become the focus of continuous complaint and confusion. In this issue, Fern Potvin reports on how some of the largest MCOs throughout the country have been rated according to the National Committee for Quality Assurance, which has developed a system of performance measures and accreditation. Also included in this issue is a state-by-state listing from Family Voices of their Coordinators serving as advocates for families in their states who are dealing with insurance issues.

EP on-line

Use of the Internet is now such an integral part of our lives that we think nothing of turning to it first for information. This raises some concerns as to the quality of the information. Our Internet Projects Manager, Vanessa Ira has included some pointers in this issue on what users should expect on a Web site. Our own on-line presence at http://www.eparent.com contains the same quality information that you will find in print. As in our magazine, we would like the Web site to be a reflection of your needs. Please continue to send your suggestions for how we can "build a better Web site" via e-mail to Vanessa at: vieprnt@concentric.net or call (800) EPARENT, ext. 213

With gratitude

We are very lucky to have many caring individuals—more than we can name here—share their talents with us, both as authors and as advisors to our publication, and we wish to express our gratitude and look forward to their continued support in the coming years. Joe Valenzano and our staff here at EP, in editorial, circulation, and advertising have put forth a tremendous effort in supporting our mission. I would like to recognize and thank for their contributions: Laura Battaglia, Glenn Collucci, Anthony Cuigini, Doris DeFina, J.M. DellaValle, Francois Dufresne, Dennis Dusevic, Julie Hacker, Vanessa Ira, Gale Jurasek, Dolores Kinley, Mike Longobardi, Bridget Lyne, Kerry Pianoforte, Fern Potvin, Ann Weber, and Karen Weber, as well as our EP Library staff and our sales force.

Pictured are some of EP's staff and friends: Front (l-r): Bob Molica, J.M. DellaValle, Dennis Dusevic, Joe Miller, Ann Weber, Kerry Pianoforte, Julie Hacker with Brielle Hacker, Blucher Chacon. Second row (l-r) Bridget Lyne, Ron Richards, Gale Jurasek, Fern Potvin, Lauren Agoratus, Amy Koval, Esther Schleifer, Andrew Zerias, Joe Valenzano, Dolores Kinley, Doris DeFina, Laura Battaglia, Glenn Collucci (directly behind Laura), Mike Manginello, Mike Longobardi, and Max Schleifer. (Not pictured: Anthony Cuigini, Vanessa Ira, Karen Weber, Francois Dufresne.)

Come join us in Atlanta

EP will co-sponsor The World Congress & Exposition on Disabilities (WCD), November 10-12, 2000 in Atlanta, Georgia. We invite individuals who have disabilities and their families, along with leading experts on disability-related fields from around the world, to come together at this forum to share their knowledge and experience.

The new year before us holds great promise, waiting to be filled with accomplishments and improvements as we cross the threshold into the new century. We hope EP can continue to be a useful source of information, and through contributions from our readers, a source of inspiration. **EP**

Best wishes for a bright and joyous New Year from everyone at EP!

—*Maxwell J. Schleifer, Ph.D.*
Editor-in-Chief

KID KART

Kid Kart Xpress

Looks Like a Stroller, But It's So Much More.

Beneath its brightly colored exterior, the ***Kid Kart Xpress*** offers a sophisticated seating and positioning system. Head and postural supports, tilt and recline capabilities and more make it a favorite with rehab professionals. Parents love the fact that it folds so compactly for transport, and the rearward facing seat option allows interaction with the child while pushing. The ***Kid Kart Xpress*** even offers a transit option for safe bus tranport.

Can 911 stop
a seizure
fast enough?

You can.

Stop the seizure fast. Diastat diazepam rectal gel CIV

[illegible]

BEST COPY AVAILABLE

Diastat®

(diazepam rectal gel)
Rectal Delivery System

CIV

INDICATIONS AND USAGE

Diastat is a gel formulation of diazepam intended for rectal administration in the management of selected, refractory, patients with epilepsy, on stable regimens of AEDs, who require intermittent use of diazepam to control bouts of increased seizure activity.

Evidence to support the use of Diastat was adduced in two controlled trials that enrolled patients with partial onset or generalized convulsive seizures who were identified jointly by their caregivers and physicians as suffering intermittent and periodic episodes of markedly increased seizure activity, sometimes heralded by non-convulsive symptoms, that for the individual patient were characteristic and were deemed by the prescriber to be of a kind for which a benzodiazepine would ordinarily be administered acutely. Although these clusters or bouts of seizures differed among patients, for any individual patient the clusters of seizure activity were not only stereotypic but were judged by those conducting and participating in these studies to be distinguishable from other seizures suffered by that patient. The conclusion that a patient experienced such unique episodes of seizure activity was based on historical information.

CONTRAINDICATIONS

Diastat is contraindicated in patients with a known hypersensitivity to diazepam. Diastat may be used in patients with open angle glaucoma who are receiving appropriate therapy but is contraindicated in acute narrow angle glaucoma.

WARNINGS

General

Diastat should only be administered by caregivers who in the opinion of the prescribing physician 1) are able to distinguish the distinct cluster of seizures (and/or the events presumed to herald their onset) from the patient's ordinary seizure activity, 2) have been instructed and judged to be competent to administer the treatment rectally, 3) understand explicitly which seizure manifestations may or may not be treated with Diastat, and 4) are able to monitor the clinical response and recognize when that response is such that immediate professional medical evaluation is required.

CNS Depression

Because Diastat produces CNS depression, patients receiving this drug who are otherwise capable and qualified to do so should be cautioned against engaging in hazardous occupations requiring mental alertness, such as operating machinery, driving a motor vehicle, or riding a bicycle until they have completely returned to their level of baseline functioning.

Pregnancy Risks

Animal Findings: Diazepam has been shown to be teratogenic in mice and hamsters when given orally at single doses of 100 mg/kg or greater (approximately eight times the maximum recommended human dose [MRHD=1 mg/kg/day] or greater on a mg/m^2 basis).

General Concerns and Considerations About Anticonvulsants: Reports suggest an association between the use of anticonvulsant drugs by women with epilepsy and an elevated incidence of birth defects in children born to these women.

General Concerns About Benzodiazepines: An increased risk of congenital malformations associated with the use of benzodiazepine drugs has been suggested in several studies. There may also be non-teratogenic risks associated with the use of benzodiazepines during pregnancy. There have been reports of neonatal flaccidity, respiratory and feeding difficulties, and hypothermia in children born to mothers who have been receiving benzodiazepines late in pregnancy. In addition, children born to mothers receiving benzodiazepines on a regular basis late in pregnancy may be at some risk of experiencing withdrawal symptoms during the postnatal period.

Advice Regarding the Use of Diastat in Women of Childbearing Potential: In general, the use of Diastat in women of childbearing potential, and more specifically during known pregnancy, should be considered only when the clinical situation warrants the risk to the fetus.

The specific considerations addressed above regarding the use of anticonvulsants in epileptic women of childbearing potential should be weighed in treating or counseling these women.

Because of experience with other members of the benzodiazepine class, Diastat is assumed to be capable of causing an increased risk of congenital abnormalities when administered to a pregnant woman during the first trimester. The possibility that a woman of childbearing potential may be pregnant at the time of institution of therapy should be considered. If this drug is used during pregnancy, or if the patient becomes pregnant while taking this drug, the patient should be apprised of the potential hazard to the fetus. Patients should also be advised that if they become pregnant during therapy or intend to become pregnant they should communicate with their physician about the desirability of discontinuing the drug.

Withdrawal Symptoms

Withdrawal symptoms of the barbiturate type have occurred after the discontinuation of regular use of benzodiazepines.

Chronic Use

Diastat is not recommended for chronic, daily use as an anticonvulsant because of the potential for development of tolerance to diazepam. Chronic daily use of diazepam may increase the frequency and/or severity of tonic clonic seizures, requiring an increase in the dosage of standard anticonvulsant medication. In such cases, abrupt withdrawal of chronic diazepam may also be associated with a temporary increase in the frequency and/or severity of seizures.

Use in Patients with Petit Mal Status

Tonic *status epilepticus* has been precipitated in patients treated with IV diazepam for petit mal status or petit mal variant status.

PRECAUTIONS

Caution in Renally Impaired Patients

Caution should be exercised in the administration of the drug to patients with impaired renal function.

Caution in Hepatically Impaired Patients

Concomitant liver disease is known to decrease the clearance of diazepam. Therefore, Diastat should be used with caution in patients with liver disease.

Use in Pediatrics

The controlled trials demonstrating the effectiveness of Diastat included children two years of age and older.

Use in Patients with Compromised Respiratory Function

Diastat should be used with caution in patients with compromised respiratory function related to a concurrent disease process (e.g., asthma, pneumonia) or neurologic damage.

Use in Elderly

In elderly patients Diastat should be used with caution.

Information to be Communicated by the Prescriber to the Caregiver

Prescribers are strongly advised to take all reasonable steps to ensure that caregivers fully understand their role and obligations vis a vis the administration of Diastat to individuals in their care.

Interference With Cognitive and Motor Performance: Because benzodiazepines have the potential to impair judgment, thinking, or motor skills, patients should be cautioned about operating hazardous machinery, including automobiles, until they are reasonably certain that Diastat therapy does not affect them adversely.

Pregnancy: Patients should be advised to notify their physician if they become pregnant or intend to become pregnant during therapy with Diastat.

Nursing: Patients should be advised not to breast-feed for an appropriate period of time after receiving treatment with Diastat.

Concomitant Medication

The potential for a synergistic CNS-depressant effect when used simultaneously with alcohol or other CNS-depressants must be considered by the prescribing physician, and appropriate recommendations made to the patient and/or caregiver.

Drug Interactions

If Diastat is to be combined with other psychotropic agents or other CNS depressants, careful consideration should be given to the pharmacology of the agents to be employed—particularly with known compounds which may potentiate the action of diazepam, such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants.

The clearance of diazepam and certain other benzodiazepines can be delayed in association with cimetidine administration. Valproate may potentiate the CNS-depressant effects of diazepam.

As with all drugs, the potential for interaction by a variety of mechanisms is a possibility.

Effect of Other Drugs On Diazepam Metabolism: Potential interactions may occur when diazepam is given concurrently with agents that affect CYP2C19 and CYP3A4 activity. Potential inhibitors of CYP2C19 (e.g., cimetidine, quinidine, and tranylcypromine) and CYP3A4 (e.g., ketoconazole, troleandomycin, and clotrimazole) could decrease the rate of diazepam elimination, while inducers of CYP2C19 (e.g., rifampin) and CYP3A4 (e.g., carbamazepine, phenytoin, dexamethasone and phenobarbital) could increase the rate of elimination of diazepam.

Effect of Diazepam On the Metabolism of Other Drugs: Diazepam may interfere with the metabolism of drugs which are substrates for CYP2C19, (e.g. omeprazole, propranolol, and imipramine) and CYP3A4 (e.g. cyclosporine, paclitaxel, terfenadine, theophylline, and warfarin) leading to a potential drug-drug interaction.

Carcinogenesis, Mutagenesis, Impairment of Fertility

In studies in which mice and rats were administered diazepam in the diet at a dose of 75 mg/kg/day (approximately six and 12 times, respectively, the maximum recommended human dose [MRHD=1 mg/kg/day] on a mg/m^2 basis) for 80 and 104 weeks, respectively, an increased incidence of liver tumors was observed in males of both species. The data currently available are inadequate to determine the mutagenic potential of diazepam. Reproduction studies in rats showed decreases in the number of pregnancies and in the number of surviving offspring following administration of an oral dose of 100 mg/kg/day (approximately 16 times the MRHD on a mg/m^2 basis).

Labor and Delivery

Diastat is not recommended for obstetrical use.

Nursing Mothers

Patients should be advised not to breast-feed for an appropriate period of time after receiving treatment with Diastat.

ADVERSE REACTIONS

Diastat adverse event data were collected from double-blind, placebo-controlled studies and open-label studies. The majority of adverse events were mild to moderate in severity and transient in nature.

Two patients who received Diastat died seven to 15 weeks following treatment; neither of these deaths was deemed related to Diastat.

The most frequent adverse event reported to be related to Diastat in the two double-blind, placebo-controlled studies was somnolence (23%). Less frequent adverse events were dizziness, headache, pain, abdominal pain, nervousness, vasodilatation, diarrhea, ataxia, euphoria, incoordination, asthma, rhinitis, and rash, which occurred in approximately 2-5% of patients.

Approximately 1.4% of the 573 patients who received Diastat in clinical trials of epilepsy discontinued treatment because of an adverse event. The adverse event most frequently associated with discontinuation (occurring in three patients) was somnolence. Other adverse events most commonly associated with discontinuation and occurring in two patients were hypoventilation and rash. Adverse events occurring in one patient were asthenia, hyperkinesia, incoordination, vasodilitation and urticaria. These events were judged to be related to Diastat.

In the two domestic double-blind, placebo-controlled, parallel-group studies, the proportion of patients who discontinued treatment because of adverse events was 2% for the group treated with Diastat, versus 2% for the placebo group. In the Diastat group, the adverse events considered the primary reason for discontinuation were different in the two patients who discontinued treatment; one discontinued due to rash and one discontinued due to lethargy. The primary reason for discontinuation in the patients treated with placebo was lack of effect.

Adverse Event Incidence in Controlled Clinical Trials

Table 1 lists treatment-emergent signs and symptoms that occurred in > 1% of patients enrolled in parallel-group, placebo-controlled trials and were numerically more common in the Diastat group. Adverse events were usually mild or moderate in intensity.

The prescriber should be aware that these figures, obtained when Diastat was added to concurrent antiepileptic drug therapy, cannot be used to predict the frequency of adverse events in the course of usual medical practice when patient characteristics and other factors may differ from those prevailing during clinical studies. Similarly, the cited frequencies cannot be directly compared with figures obtained from other clinical investigations involving different treatments, uses, or investigators. An inspection of these frequencies, however, does provide the prescribing physician with one basis to estimate the relative contribution of drug and non-drug factors to the adverse event incidences in the population studied.

TABLE 1: Treatment-Emergent Signs And Symptoms That Occurred In > 1% Of Patients Enrolled In Parallel-Group, Placebo-Controlled Trials And Were Numerically More Common In The Diastat Group

Body System	COSTART Term	Diastat N = 101 %	Placebo N = 104 %
Body As A Whole	Headache	5%	4%
Cardiovascular	Vasodilatation	2%	0%
Digestive	Diarrhea	4%	<1%
Nervous	Ataxia	3%	<1%
	Dizziness	3%	2%
	Euphoria	3%	0%
	Incoordination	3%	0%
	Somnolence	23%	8%
Respiratory	Asthma	2%	0%
Skin and Appendages	Rash	3%	0%

Other events reported by 1% or more of patients treated in controlled trials but equally or more frequent in the placebo group than in the Diastat group were abdominal pain, pain, nervousness, and rhinitis. Other events reported by fewer than 1% of patients were infection, anorexia, vomiting, anemia, lymphadenopathy, grand mal convulsion, hyperkinesia, cough increased, pruritus, sweating, mydriasis, and urinary tract infection.

The pattern of adverse events was similar for different age, race and gender groups.

Other Adverse Events Observed During All Clinical Trials: Diastat has been administered to 573 patients with epilepsy during all clinical trials, only some of which were placebo-controlled. During these trials, all adverse events were recorded by the clinical investigators using terminology of their own choosing. To provide a meaningful estimate of the proportion of individuals having adverse events, similar types of events were grouped into a smaller number of standardized categories using modified COSTART dictionary terminology. These categories are used in the

listing below. All of the events listed below occurred in at least 1% of the 573 individuals exposed to Diastat. All reported events are included except those already listed above, events unlikely to be drug-related, and those too general to be informative. Events are included without regard to determination of a causal relationship to diazepam.

BODY AS A WHOLE: Asthenia

CARDIOVASCULAR: Hypotension, vasodilation

NERVOUS: Agitation, confusion, convulsion, dysarthria, emotional lability, speech disorder, thinking abnormal, vertigo

RESPIRATORY: Hiccup

The following infrequent adverse events were not seen with Diastat but have been reported previously with diazepam use: depression, slurred speech, syncope, constipation, changes in libido, urinary retention, bradycardia, cardiovascular collapse, nystagmus, urticaria, neutropenia and jaundice.

Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances and stimulation have been reported with diazepam; should these occur, use of Diastat should be discontinued.

DRUG ABUSE AND DEPENDENCE

Diazepam is a Schedule IV controlled substance and can produce drug dependence. It is recommended that patients be treated with Diastat no more frequently than every five days and no more than five times per month.

OVERDOSAGE

Flumazenil is intended as an adjunct to, not as a substitute for, proper management of benzodiazepine overdose. Patients treated with flumazenil should be monitored for resedation, respiratory depression and other residual benzodiazepine effects for an appropriate period after treatment.

The prescriber should be aware of a risk of seizure in association with flumazenil treatment, particularly in long-term benzodiazepine users and in cyclic antidepressant overdose.

DOSAGE AND ADMINISTRATION

(see Also Patient/Caregiver Package Insert)

A decision to prescribe Diastat involves more than the diagnosis and the selection of the correct dose for the patient.

First, the prescriber must be convinced from historical reports and/or personal observations that the patient exhibits the characteristic identifiable seizure cluster that can be distinguished from the patient's usual seizure activity by the caregiver who will be responsible for administering Diastat.

Second, because Diastat is only intended for adjunctive use, the prescriber must ensure that the patient is receiving an optimal regimen of standard anti-epileptic drug treatment and is, nevertheless, continuing to experience these characteristic episodes.

Third, because a non-health professional will be obliged to identify episodes suitable for treatment, make the decision to administer treatment upon that identification, administer the drug, monitor the patient, and assess the adequacy of the response to treatment, a major component of the prescribing process involves the necessary instruction of this individual.

Fourth, the prescriber and caregiver must have a common understanding of what is and is not an episode of seizures that is appropriate for treatment, the timing of administration in relation to the onset of the episode, the mechanics of administering the drug, how and what to observe following administration, and what would constitute an outcome requiring immediate and direct medical attention.

Calculating Prescribed Dose

The Diastat dose should be individualized for maximum beneficial effect. The recommended dose of Diastat is 0.2-0.5 mg/kg depending on age. See the dosing table for specific recommendations.

Age (years)	Recommended Dose
2 through 5	0.5 mg/kg
6 through 11	0.3 mg/kg
12 and older	0.2 mg/kg

Because Diastat is provided in fixed, unit-doses of 5, 10, 15 and 20 mg, the prescribed dose is obtained by rounding upward to the next available dose. The following table provides acceptable weight ranges for each dose and age category, such that patients will receive between 90% and 180% of the calculated recommended dose. The safety of this strategy has been established in clinical trials.

2 - 5 Years 0.5 mg/kg		6 - 11 Years 0.3 mg/kg		12+ Years 0.2 mg/kg	
Weight (kg)	Dose (mg)	Weight (kg)	Dose (mg)	Weight (kg)	Dose (mg)
6 to 11	5	10 to 18	5	14 to 27	5
12 to 22	10	19 to 37	10	28 to 50	10
23 to 33	15	38 to 55	15	51 to 75	15
34 to 44	20	56 to 74	20	76 to 111	20

In elderly and debilitated patients, it is recommended that the dosage be adjusted downward to reduce the likelihood of ataxia or oversedation.

A 2.5 mg dose is available for use as a supplemental dose. This dose may be prescribed at the discretion of the physician for patients who require more precise dose titration than is achieved using one of the four standard doses provided. The 2.5 mg dose may also be used as a partial replacement dose for patients who may expel a portion of the first dose.

Additional Dose

The prescriber may wish to prescribe a second dose of Diastat. A second dose, when required, may be given 4-12 hours after the first dose.

Treatment Frequency

It is recommended that Diastat be used to treat no more than five episodes per month and no more than one episode every five days.

CAUTION: Federal law prohibits dispensing without prescription.

CAUTION: Federal law prohibits the transfer of this drug to any person other than the patient for whom it was prescribed.

HARD MANUFACTURING

AGE APPROPRIATE

BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas

The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents. . . I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs, as well as locating your nearest HARD dealer, please give me a call.

Exceptional Parent

is the magazine for parent and professionals involved the care and development children and young adults with special needs, includi Physical Disabilities, Developmental Disabilitie Mental Retardation, Autisr Epilepsy, Learning Disabilit Perceptual Disabilities, Hearing Impairments, Visi Impairments, Emotional Problems, Chronic Illness.

Exceptional Parent's MISSION IS TO:

PROVIDE
practical guidance and support for parents, educators and professionals;

INFORM
parents and professionals about current and changing rights, laws and programs for children and young adults with disabilities, and their families;

SERVE
as a network, a forum for the exchange of ideas, experience and advice between parents, professionals and educators;

FOCUS
on the child first, the disability second.

FINALLY, A Nutrition Supplement For Special Needs...

NuTriVene-D

Targeted Nutrition Intervention

Ask your physician about NuTriVene-D
Or call for more information or to order
1-800-899-3413

As Seen On ABC News Nightline, The 700 Club, and 48 Hours

Children and adults with Down syndrome and other genetic disorders have unique nutritional needs. Now there's a nutrition supplement formulated for those special needs.

NuTriVene nutritional supplements include vitamins, minerals, amino acids, antioxidants, and other essential nutrients. NuTriVene may also be customized for the nutritional needs of your child.

NuTriVene does not require a prescription, although we encourage you to talk to your physician about NuTriVene.

NuTriVene may be mixed with infant formulas, foods, and many drinks. And, it contains no artificial colorings or flavorings.

"As skeptical parents we were completely amazed at the changes that occurred in our son after he started NuTriVene. He is more alert, curious, and much healthier." L. Sotok - Holland, MI

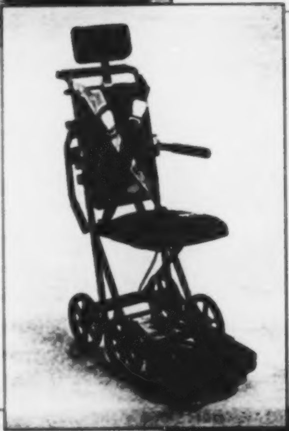
Imagination Takes Flight

Columbia Medical Manufacturing Corporation

With the invention of an innovative device, a scientist makes travel more accessible for people with disabilities.



Columbia Medical, founder, Michael Caan, (left) is the inventor of the AisleMaster. The device (center & bottom) transports people with mobility-related disabilities on aircraft as well as on ships, trains and buses.

As a scientist for NASA geophysical studies, Michael Caan's work allowed him to learn about the physical forces on our planet. It was little wonder that after leaving NASA, he decided to put his knowledge of physics to work by helping people safely overcome physical limitations. He started his business, Columbia Medical Manufacturing Corporation, by making safety products in the garage of the suburban California home he shares with his wife and two daughters.

When the ADA (The Americans with Disabilities Act) and the Air Carrier Access Act made accommodating passengers with disabilities an important consideration for air carriers, Caan saw a need that would have to be filled. Airlines had to find a safe, economical, and comfortable way to board and transport people who use mobility devices. Cruise ships and trains would also be affected.

Designing the right type of chair was a challenge with conflicting requirements for Caan and his company, which had grown to include several other design professionals. "The chair had to be lightweight to make it easy to lift, yet strong enough to hold heavy users. It also had to be compact enough to fit on an aircraft and comfortable for the user. In addition, the chair had to be simple to use, and affordable for the airlines to purchase," explains Caan.

In an effort to achieve these standards, Caan and his team consulted with a number of commercial airlines. Caan's first customer was American Airlines. "They were particularly receptive of first samples, while giving us very knowledgeable input," he recalls.

After experimenting with many different types of products, Caan came up with the AisleMaster Boarding Chair. Weighing in at only 33 pounds, with a 15 inch-wide wheelbase, the wheelchair is compact and versatile. Unique features include an adjustable headrest; crisscrossing, color-coded body straps to hold the passenger securely and comfortably; and thigh and ankle straps. In an effort to reduce risks and make boarding easier, the AisleMaster Chair's headrest lowers, the armrests flip up, and the seat acts as a sliding board.

Columbia Medical now makes both boarding and on-board chairs. There are currently three types of chairs in use by commercial airlines:

1) Terminal chairs used within airport terminals.
2) Boarding wheelchairs, which are often needed to transport passengers up stairs and down narrow aisles of a plane.
3) On-board chairs for larger aircraft, used for evacuations or to get passengers to the lavatory during a flight.

In addition to the 15 inch-wide model, Columbia has also designed a 12-inch version of the AisleMaster Chair for use on commuter airlines and buses where extra narrow aisles exist. For passengers with disabilities, this opened up a new world of travel opportunity. "Previously, passengers had to be physically hand-carried up and down the steps. This evolution is significant given the enormous growth of 'feeder' airports using regional airlines feeding into "hubs" for nationwide carriers," explains Caan.

Today, the AisleMaster is sold to over 60 airlines and has been purchased individually by actor Christopher Reeve, and by President Clinton for use aboard Air Force One when he injured his knee a few years ago. Caan and his staff at Columbia Medical also put their minds to designing more "down to earth" products including bath seats, commodes, and car seats, continuing to push the limits of accessible design for people with disabilities of all ages.

Travelers should check with their airlines in advance to make sure the AisleMaster will be available at the departure gate. **EP**

PUBLISHERS LETTER

The Power of Parent Persistence

When we think of a hero, we often think of a person who is larger than life. Heroes, however, do walk among us in everyday life. I would like to tell you about one who is very much a part of the Exceptional Parent family: Julie Venners Hacker, our associate publisher. She has been selected as the recipient of a Joseph P. Kennedy, Jr. Fellowship in Public Policy. Julie has demonstrated what I like to call the Power of Parent Persistence. On January 1, 2000, Julie will begin the one-year fellowship in Washington, D.C. There she will continue to learn and grow, and acquire new skills in advocacy on behalf of those with disabilities. For Julie, and for Exceptional Parent, this is a tremendous honor and we are very proud of what she has accomplished and profoundly grateful that she has been such an integral part of the Exceptional Parent family. We know that she will continue to be successful and that she will make a significant contribution in the lives people with disabilities.

JULIE VENNERS HACKER

As Julie accepts the heartfelt congratulations of all those who wish her well and prepares to take on her new responsibilities, I would like to share some perspectives that are constant reminders of the journey that has led to this outstanding achievement.

I first met Julie at a National Organization for Rare Disorders (NORD) Conference in Dallas, Texas in 1996. With her was her daughter, Brielle, then 2 years old, who had been diagnosed with mitochondrial myopathy. Julie had come to the NORD conference to gain knowledge and gather support to help her in dealing with her daughter's disability. What struck me immediately about Julie was her energy, devotion, and commitment. And, I was captivated by Brielle; though her disease tired her out much of the time, her bright blue eyes were always shining and she could always muster a smile that melted your heart.

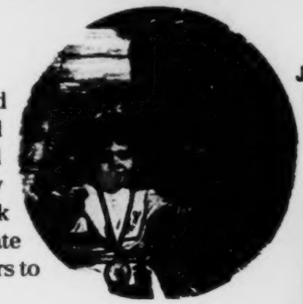
SAY CHEESE! BRIELLE HACKER, NOW 5½, HAS COME A LONG WAY FROM THE FRAIL CHILD SHE ONCE WAS.

A story to share

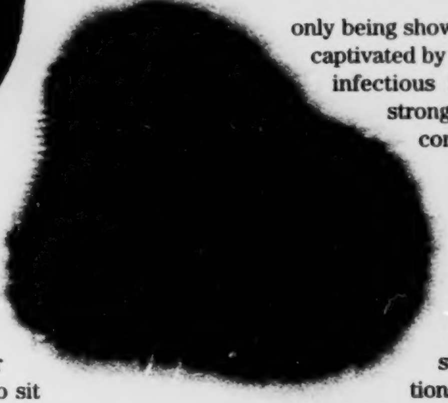
Julie told me how little was known about mitochondrial myopathy and how she wanted do something about that. She had already created her own non-profit foundation, the Juvenile Undiagnosed Mitochondrial Problems (J.U.M.P.) Foundation to help raise awareness and fund research into this mysterious disease. She also told me about Brielle and her condition. In 1996, Brielle's medical prognosis was not good. Mitochondrial myopathy is a hereditary disease in which the mitochondria (the powerhouse of the cells in our bodies) do not produce enough adenosine triosphate (ATP), which gives the body its energy.

Some leading neurologists told Julie that Brielle would never walk and would always have severe motor and intellectual delays. As an infant, Brielle could not eat solid foods and Julie was told that her daughter would need to be tube fed. But Julie was unwilling to accept that without a fight. Instead, with incredible patience, love,and dedication, she sat for hours on end holding and feeding Brielle the only thing she would eat—cream from those small containers used for coffee. Brielle began gaining strength this way and has not needed a tube. Eventually, when it was discovered that she had carnitine deficiency, Brielle began receiving medication which dramatically improved her condition.

I was resolved to have Julie tell her story in print—and she did. The article in our May 1997 issue served as the introduction to Exceptional Parent's three-part educational series on mitochondrial and metabolic disorders, which Julie helped coordinate. This special report served to increase awareness, among physicians and parents alike, of this pervasive and debilitating condition. The educational



Julie (below with her daughter) founded the non-profit J.U.M.P. to raise awareness for mitochondrial myopathy. Champion cyclist, Greg LeMond, (left) who also has the disease, agreed to be J.U.M.P.'s spokesperson. Here he holds Brielle on a trike.



series was also reproduced into two monographs and distributed to physicians and families internationally. Now in its third printing, this work has the potential to educate the next generation of doctors to be alert for this disorder.

Making a difference

This dedication to helping others prompted me to invite Julie to come to work with us at Exceptional Parent. I wanted this person, who had displayed such courage and dignity, to become part of the EP family. For her, however, it was not a simple transition or corporate move. Julie is the sole caregiver for her daughter, who then was nonverbal, frail, barely able to sit upright or eat solid foods, and had to be carried everywhere. She would have to find new support systems and make new friends. Making this move also meant that Julie had to negotiate with a different early intervention and school system, ones which did not offer many of the services that Brielle received in Michigan. But Julie wanted to join Exceptional Parent because, as she so often reminded us, she "wanted to make a difference." With the same resolve she had always shown, Julie uprooted herself from familiar surroundings and moved with Brielle from Michigan to New Jersey.

Julie did make a new life for herself and Brielle. All of her friends and colleagues here at the magazine have watched, with concern, anxiety, amazement, and pride as, day by day, Julie and Brielle did battle with her condition. We have witnessed Brielle grow stronger, from a small child with little muscle tone who would not eat, to an active little girl who now feeds herself. It was a source of great joy when Brielle finally was able to finish a plate of spaghetti! But nothing tops watching her today as she walks (but mostly runs!), albeit with the assistance of some specially designed braces for her legs. We were all delighted the day Julie told us how Brielle climbed the steps of the slide at her day care center by herself, after only being shown once. And I am still captivated by those bright eyes, that infectious smile, and now, her strong ringing laughter and constant chatter, too.

Julie is a shining example of the Power of Parental Persistence. If Julie did not demonstrate a willingness to support Brielle, if she did not have the strength of her convictions to believe that she could help her daughter, none of this would be possible. It is easy to fall into the depths of despair when faced with the incredible, sometimes daunting task of parenting a child with a disability. But just as is the case with the many valiant parents of children with special needs, Julie did not stop for self-pity; she knew that there was work to be done. She knew that information was of great importance and so she learned as much as she could about her daughter's disability. She sought out experts in the field of metabolic disease, and groups like NORD. She learned that she was not alone; that there were other people in the world who cared. She also did not stop after Brielle got the help she needed. Julie went forth and took what she had learned and tried to help others with J.U.M.P. and in her role at Exceptional Parent. She said she wanted to make a difference—and she has!

Julie and her children [illegible]

Congratulations, Julie. Thank you for being a part of the Exceptional Parent Family and for being a constant reminder to all of us of the power of patience, persistence, and love. Good luck and God Speed.

With Great
Admiration
and Respect,

Joseph M Valenzano Jr

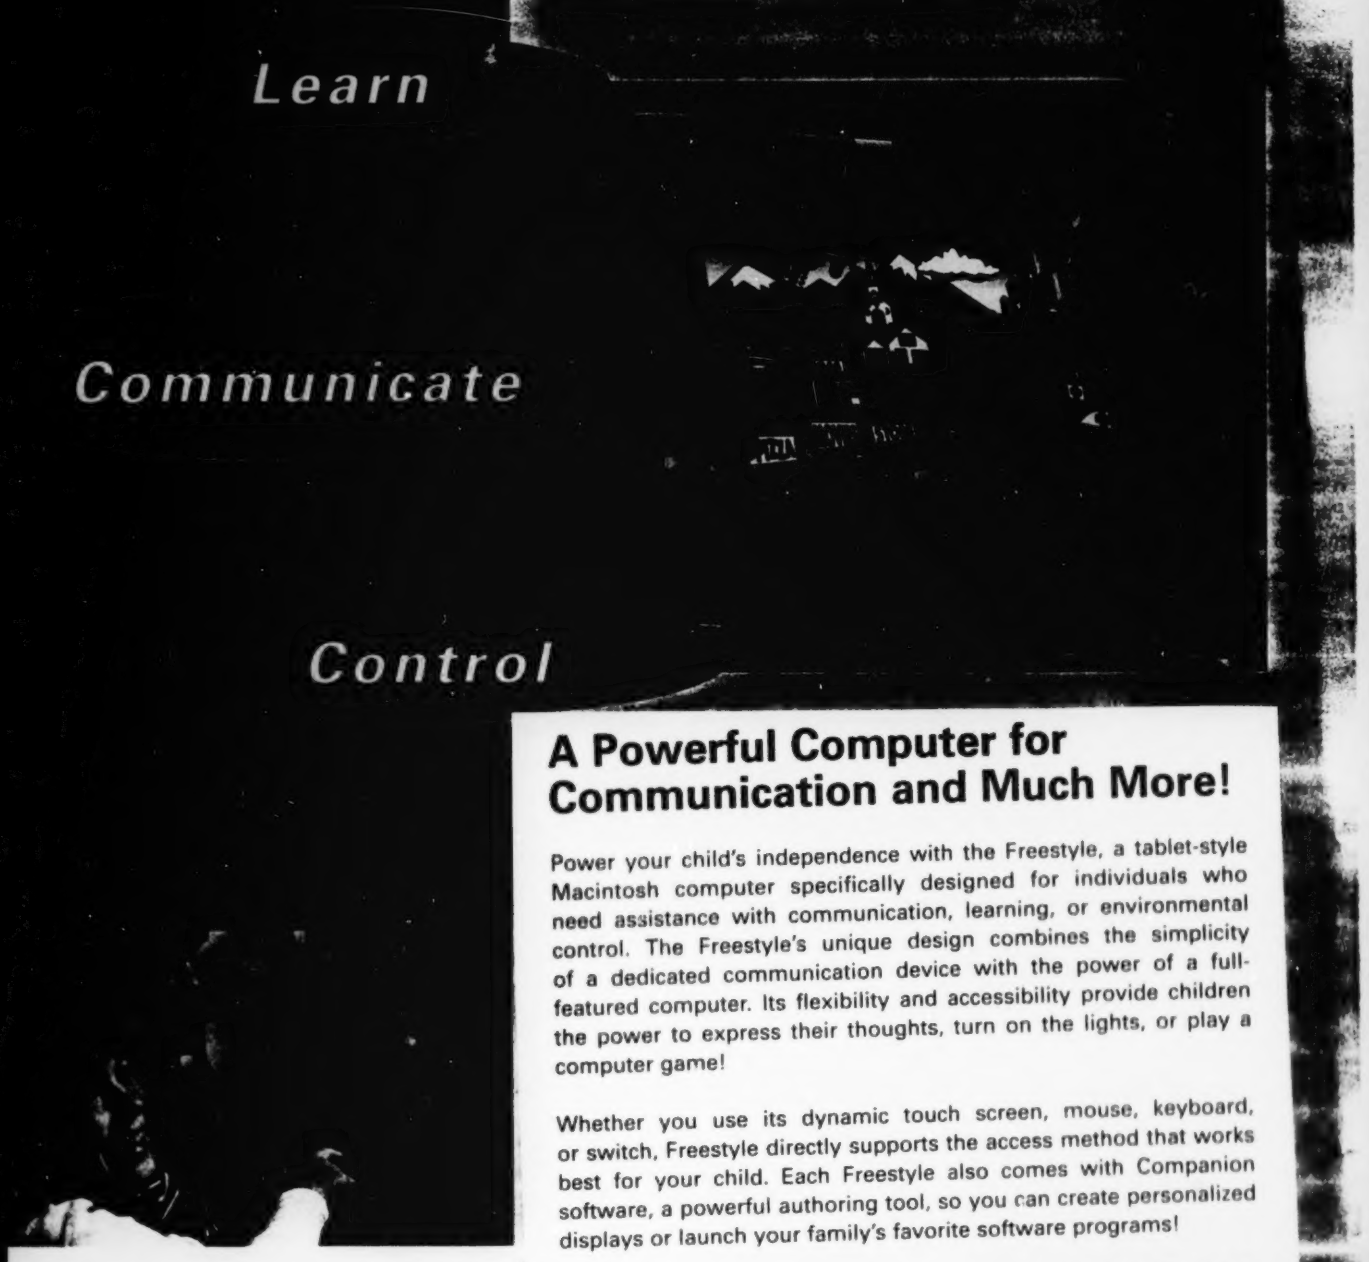
Freestyle™



A Powerful Computer for Communication and Much More!

Power your child's independence with the Freestyle, a tablet-style Macintosh computer specifically designed for individuals who need assistance with communication, learning, or environmental control. The Freestyle's unique design combines the simplicity of a dedicated communication device with the power of a full-featured computer. Its flexibility and accessibility provide children the power to express their thoughts, turn on the lights, or play a computer game!

Whether you use its dynamic touch screen, mouse, keyboard, or switch, Freestyle directly supports the access method that works best for your child. Each Freestyle also comes with Companion software, a powerful authoring tool, so you can create personalized displays or launch your family's favorite software programs!

Call us or visit our website to find out more about the Freestyle and how it can open new doors to independence for your child.

Circle #90

National Resources for Specific Disabilities

This directory includes national groups and organizations that can serve as resources for parents and professionals seeking information and support regarding specific disabilities and conditions. Please note that information on some specific disabilities may also be available from Federal and Federally-Funded Information Resources, Parent to Parent Programs, or certain National Information and Advocacy Resources (see Table of Contents for page numbers). In addition, Matching Resources, at the end of this directory, may also be useful.

CROSS-REFERENCING

Categories have been cross-referenced where appropriate.

Many conditions are known by more than one name. Readers are directed to "See" other relevant category names where resources are also listed. Under CHROMOSOME 4P-, for example, readers are referred to WOLF-HIRSCHHORN SYNDROME.

Some specific disabilities are not covered by a specific national organization. These conditions may be cross-referenced to a broader category that includes organizations that can provide helpful resources. For example, the metabolic condition ARGINASE DEFICIENCY is cross-referenced to UREA CYCLE DISORDERS. In some cases, the reader may be directed to a similar (but not identical) condition, when groups for that condition have indicated the ability and willingness to provide appropriate information and support. For example, 45,X SYNDROME is cross-referenced to TURNER'S SYNDROME and HYPOPIGMENTATION.

In cases where resources are available for both a general category of disability (for example, VISUAL IMPAIRMENT), as well as specific conditions within that general category (for example, ALBINISM; GLAUCOMA; MACULAR DISEASES; RETINITIS PIGMENTOSA; RETINOBLASTOMA; SEPTO-OPTIC DYSPLASIA; and USHER SYNDROME), cross-referencing goes in two directions. Under VISUAL IMPAIRMENTS, for example, readers are informed of the types of visual impairments for which specific resources exist; and under each specific type of visual impairment, readers are referred back to the more general category. The only exception to this type of cross-referencing is the general category MENTAL RETARDATION, which is not used as a cross-referencing term.

In cases where one specific condition usually includes other conditions, but those other conditions do not necessarily include the first condition, cross-referencing goes in one direction only. For example, under LAURENCE-MOON-BARDET-BIEDL SYNDROME (LMBBS), readers are directed to "See also" KIDNEY DISORDERS and RETINITIS PIGMENTOSA, though neither of these conditions refer back to LMBBS. This is because LMBBS typically includes kidney complications and retinitis pigmentosa, but a primary diagnosis of either one of these conditions does not typically include LMBBS.

Cross-referencing assistance came from the organizations listed in this directory, from the National Organization for Rare Disorders (NORD) and their *Resource Guide* (third edition, 1997, available for $43.50 through the Exceptional Parent Library [800] 535-1910; catalogue number NO200D), and from the *Physician's Guide to Rare Diseases* (second edition, 1995, edited by Jess G. Thoene, M.D., which is also available from the Exceptional Parent Library).

USING THIS DIRECTORY

A description of services provided by individual groups follows each listing in this directory. Numbers correspond to items listed in the **Key to Services**, which appears on every other page. When available, e-mail addresses and World Wide Web sites have been included. E-mail addresses are indicated by the symbol, ✉. Web sites are listed with the standard **http://** before each. Children's
Motrin

Moms can learn a lot from their kids about feeling better.

You know how you rely on Children's Motrin to bring down your children's fever. Well there's also a Motrin made for grown-up aches, pains and headaches. Motrin IB gets to the pain before the pain gets to you. So you'll feel all better. **Life is too good to feel bad.**

Motrin

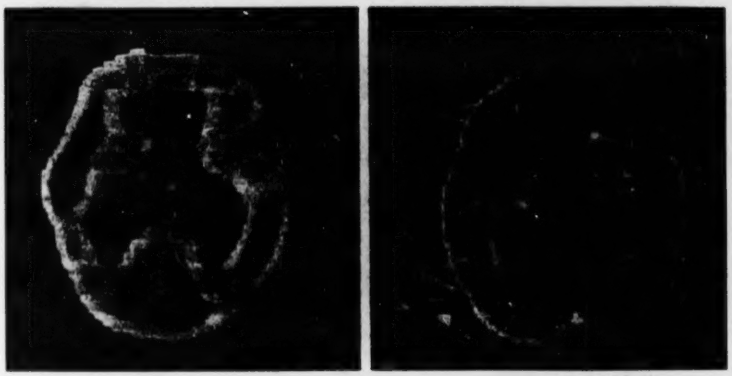
There's a new hope for children

with

Cerebral Palsy and Brain Injury.

Recent evidence from around the world strongly suggests that hyperbaric oxygenation may be an effective therapy in treating Cerebral Palsy and the brain injured child.

The SPECT scans to the right demonstrate a potential recovery of dormant low oxygen brain cells responding to a high dosage of oxygen. This represents a significant clinical improvement.



Before *After*
(red indicates improvement)

Increase your child's reading speed and comprehension with the Kurzweil 3000™ system.

Scan any printed material and the Kurzweil 3000 system displays a full-color version, including pictures and illustrations, *then reads aloud to your child*. Your child can read along, take notes, and highlight words right on the computer screen. A 175,000 word on-line dictionary allows the child to hear the definitions of unfamiliar words, which appear on the screen instantly and are read aloud.

With a click of a button, the Kurzweil 3000 system will also read aloud Web pages, opening up a whole new world of research and learning.

Call us today at (800) 894-KESI (5374) or visit our Web site at www.kurzweiledu.com/ep.html to request a free demo CD and the results of a scientific study to learn how the Kurzweil 3000 can help improve your child's reading skills.

Product Features

- Talking dictionary with over 175,000 words with synonyms.
- Words are highlighted on the screen as they are spoken.
- Study skill feature set provides tools that support standardized study methodologies.
- Print scanned documents/notes.

We're looking for a few exceptional women.

The residents of Riverbrook are exceptional, indeed. Not because of their developmental disabilities, but because of their will to succeed.

Here at Riverbrook in the Berkshires, we take that will, and we nurture it. With personal care, 24 hours a day. And endless activities, from skating to singing lessons. Jobs at the local inn to nights at the symphony.

The result is a group of women who are more accomplished and confident with each passing day.

We have a few spots open and look forward to adding new members to our family. If you know an exceptional woman who could benefit from all that Riverbrook has to offer, call for a brochure. Or better yet, come up for a visit.

RIVERBROOK
Where exceptional women thrive.

Sigma-Tau Pharmaceuticals: Where the Patient Comes First

Sigma-Tau Pharmaceuticals is guided by the principle that no patient should ever be overlooked, no matter how rare his or her disorder. Sigma-Tau places great emphasis on fully understanding metabolic disorders and on developing products for these conditions and other rare or less known disorders. We believe that patients shouldn't have to worry about where their next medication will come from - or if they'll get the right treatment. No matter how small the patient population, we endeavor to foster consumer knowledge about and comfort with the use of our products.

Sigma-Tau works hard to put a face on unmet medical needs and to maintain strong partnerships with healthcare professionals in order to provide resources that can help answer difficult questions about metabolic disorders and commonly misdiagnosed diseases. Sigma-Tau is a leader in patient and physician education and awareness campaigns to address childhood diseases that are commonly characterized by misdiagnosis (an incorrect diagnosis) or missed diagnosis (no diagnosis).

"Sigma-Tau Pharmaceuticals is pleased to be a founding sponsor of the first World Congress & Exposition on Disabilities," says Kenneth Mehrling, Executive Vice President. "We feel that this is a tremendously valuable forum in which patients, families, physicians and associations can come together to share information and provide benefits to those with disabilities. We are proud to be part of this event because it supports Sigma-Tau's goal to help ensure that no patient is overlooked."

Among the products that Sigma-Tau develops and produces are orphan drugs – drugs with a treatment population of fewer than 200,000 patients. For example, Sigma-Tau offers Carnitor® (levocarnitine), the only prescription form of levocarnitine available for the treatment of carnitine deficiency. As many as 375,000 people suffer from various metabolic abnormalities, which may cause carnitine deficiency – a condition that can be difficult to diagnose since its symptoms often mimic those of other disorders.

Always mindful of helping patients gain access to needed drugs, Sigma-Tau funds patient assistance programs through the National Organization for Rare Disorders (NORD) for its prescription products to help ensure that underinsured and financially needy patients receive the products at no cost. These kinds of programs help to keep us in constant contact with the communities we serve and help us to make sure that no patient is overlooked. We are proud to work with many medical and patient advocacy groups, community organizations and research foundations, including NORD, the National Kidney Foundation, the United Mitochondrial Disease Foundation, the Epilepsy Foundation, the Child Neurology Society, the American Academy of Pediatrics and others.

For more information about Sigma-Tau, visit the Sigma-Tau website at www.sigma-tau.com or call 800-447-0169.

Exposition on Disabilities

The first international forum of "information that matters from people who care" for people who care: families and professionals in science, medicine, education and advocacy.

November 10-12, 2000, Atlanta, Georgia

Exceptional Parent Magazine and H.A. Bruno, LLC invite families of people with disabilities and professionals from the fields of healthcare and education from across the United States, Canada and around the world to share information, strategies, experiences, ideas and innovations.

A World-Class Weekend

Join forces and voices for people with disabilities

For Families and Caregivers: Experienced parents and professionals share first-hand, hands-on and first-person strategies and techniques for planning and problem solving in the home, the family, the community and the world at large. 400 associations are invited to share programs, projects and advocacy ideas.
Agenda items: insurance, schools, recreation, estate-planning, health care providers, employment, assessibility, technology, and many more.

For Physicians, Physical Therapists, Occupational Therapists and Educators: International experts discuss movement and brain disorders in symposia, lecture and workshop settings. Emory University's School of Medicine provides CME and CEU credits and administers a call for papers. X professional associations are also invited.
Agenda items: ataxias, spasticity, Tourette, Parkinson's, epilepsy, AD/HD, newborn screening for inborn metabolic errors, mitochondrial diseases, infant nutrition, learning disabilities, and many more.

For Those with Disabilities: Opportunities for information and hands-on introductions to the latest innovations in technology, health care, fun and advocacy.
Agenda items: Free dental and vision screening, hands-on workshops in technology and educational software, sports and recreation pavilion, Career Fair featuring live interviews with major corporations, the best toys, games and videos for fun and educational use and many more.

International Conference & Exposition on Disabilities Is Aimed at Both Professionals and Consumers

The World Congress & Exposition on Disabilities will take place November 10-12, 2000 at the Georgia International Convention Center in Atlanta. This precedent-setting conference and trade show is the first in what will be an annual event designed to educate, inform and provide a useful exchange of ideas for persons with disabilities and special health care needs, as well as for those involved in their care and development. Supported by the National Institutes of Health, several leading corporations and national associations and organizations, the event is being produced by H.A. Bruno, LLC in conjunction with Exceptional Parent magazine.

Opinion leaders in science, medicine, research, technology and product development are expected to gather along with caregivers and families for an intensive learning experience focused on the needs of all people with disabilities. Symposiums, seminars and workshops during the conference will offer professional participants CME (Continuing Medical Education) and CEU (Continuing Educational Units) accreditation through Emory University.

Uniting professional and consumer interests within one conference is a logical extension of the current health care climate, says Exceptional Parent magazine President, CEO and Publisher Joseph Valenzano. "Increasingly, families and other caregivers are becoming extraordinarily well informed about all aspects of dealing with healthcare issues, especially those related to people with disabilities. They're putting together arsenals of knowledge with which to advocate and ensure the best care, treatment and advancement for people with disabilities and special health care needs," he says.

The initial conference will feature world experts in such areas as neurology, mitochondrial and metabolic disorders, end stage renal disease, nephrology, attention deficit and hyperactivity disorders, seizure disorders such as epilepsy, nutrition, learning disabilities and movement disorders such as the ataxia's, spasticity, tourettes, the dystonias and parkinson's.

In addition to scheduled educational programs, the event will provide an opportunity to examine the latest products and services from hundreds of exhibitors. These will include representatives of the pharmaceutical, computer, automotive, mobility, personal care and travel industries, along with those associated with nutrition, communication, estate and financial planning, insurance and publishing.

Tough as nails & Cute as a button

At Otto Bock Rehab® we are concerned as much with the way a product looks and feels, as we are how well it stands up to the demands of the user. The Panda TRS Plus® is a tilt and recline, dependent mobility system designed for children with moderate to involved needs. It features a tilt of 40°, and recline of up to 140°, providing a variety of positioning adjustments. The multifunctional seating unit can be easily removed, and has the ability fo face either forward or toward the caregiver. The Panda TRS Plus has been engineered and built following the most strict standards, supported by a 5-year limited warranty. That means the Panda TRS Plus will not only look great, it will withstand years of use. Along with other products including the Busy Bee® walker, the Spee-Dee® gait trainer, and the Lisa® mobility system, Otto Bock Rehab is helping to make life a little easier, and alot more fun.

SERVICES

We review medical records to determine if a mistake at birth caused your child's disability. Our ultimate goal is to bring your case to court and to obtain the highest award of damages possible.

PRESIDENT'S MESSAGE

The satisfaction I receive upon the successful conclusion of a cerebral palsy case is immeasurable. Knowing that I have contributed to the security and future well being of a special person is the most important part of my job.

UNIQUE ATTRIBUTES

My son was born with brain damage, so I have first hand experiences and feelings to guide me when discussing your case. My family and I have become very involved with persons having all types and levels of disabilities. As an example, my wife is president of The Womens Board at Lambs Farm, a residential community for the developmentally disabled. We all volunteer frequently in many capacities there. We also support other foundations that are concerned with the betterment of special people. Our personal and professional lives revolve around persons with disabilities. We strive to bring fulfillment to the lives of our special friends. They deserve everything in life that we have, and more!

Lawyers Incorporated, P.C. is an Illinois licensed corporation with affiliated law firms throughout the United States.

Dear Parents:

When my son was born with brain damage, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing, can, even in a small way, change a child's way of life.

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

Pull-Ups
GoodNites
DISPOSABLE ABSORBENT UNDERPANTS
45 lb & over

For Better Days

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Imagine your child gaining a little more independence just by a change in clothing. For information on how GoodNites can help, please visit us at www.goodnites.com

MATCHING RESOURCES

This directory of "Matching Resources"—both national and international—can help some parents who have children with extremely rare conditions or unique combinations of disabilities. Others may be dealing with unique family situations, such as single parenting, raising twins, or adoption. These networking organizations do parent-to-parent matching based on children's disabilities and, in some cases, other unique family situations. Most maintain ongoing contact with other groups worldwide.

Unless otherwise noted, all services are provided free of charge. This symbol, ⊠, indicates an e-mail address. All international calls from the US or Canada require dialing 011 before the number. Please be aware of timezone differences when making any calls, particularly international ones. (Unless otherwise noted, telephone numbers are for voice only.)

FOUNDER Nadine O. Vogel, MBA

MANAGER David M. Harmon, CLU, ChFC, MSW

PRODUCTS AND SERVICES: MetDESK, Division of Estate Planning for Special Kids was established to extend MetLife's traditional commitment to public service to families of children with special needs. MetDESK is committed to helping families through the maze of legal and financial complexities surrounding planning for the future of a child or dependent with special needs. This includes preserving government benefits, meeting long term care needs, and structuring a plan to provide cash when it's needed most.

FOUNDER'S MESSAGE: According to Assistant Vice President and MetDESK founder Nadine O. Vogel, the strict training and continuing education requirements of the MetLife financial services representative participating in this marketplace is unique in the industry. "Special needs planning is too complex for the untrained or marginally trained financial services representative or even a general estate planning attorney. A broad one or two day training overview will not keep pace with the constant changes in federal and state government benefit laws, future trends in special needs planning, and innovations in planning techniques," she explains. In addition, 70 percent of MetDESK specialists from around the country are either parents of children with special needs or have close relatives with special needs. Vogel continues, "Parents of children with special needs feel more comfortable dealing with people who face similar issues on a day to day basis.

RECENT AWARD & ACTIVITIES: MetLife Financial Services is the 1999 Winner of the National Business & Disability Council's Valued Customer Gold Award of Honor. The Award recognizes MetLife's leadership and responding to the special needs of families of children or dependents with disabilities. The MetDESK program was hailed by business and the community at large for its efforts on behalf of people with disabilities as valued customers. Additionally, MetLife is a proud sponsor of the first annual World Congress & Exposition on Disabilities, November 2000, Atlanta, Georgia

METLIFE'S VITAL STATISTICS: Headquartered in New York City since 1868, MetLife is a leading provider of insurance and financial products and services to a broad spectrum of individual and group customers. The company, with approximately $360.7 billion of assets under management as of year-end 1998, provides individual insurance and investment products to approximately 9 million households in the U.S. MetLife also serves over 33 million people by providing group insurance and investment products to corporations and other institutions. For more information about MetLife, please visit the company's Web site at www.metlife.com.

UNIQUE ATTRIBUTES: MetDESK's management has deep roots in advocacy. This commitment and training sets the foundation for MetDESK specialists to help families with children and dependents with special needs plan for their financial futures.

SAFEGUARD YOUR CHILD'S FUTURE TODAY!

It's important that you take the time today to provide for your child's tomorrow.

At MetLife we know that parenting children with special needs takes exceptional planning. That's why we created **MetDESK** (Division of Estate Planning for Special Kids), staffed by a group of specialists who can help you navigate the many financial and legal issues involved in providing quality lifetime care for your child. Each member brings indepth knowledge and understanding of families with special needs children.

In fact, MetDESK recently received the *National Business & Disability Council's Valued Customer Gold Award of Honor* in recognition of MetLife's leadership in responding to the special needs of families of children with disabilities.

Who will care for your disabled child when you are gone?

Litigators Incorporated, P.C.
& Affiliated Law Firms

ATTORNEYS ACROSS THE NATION

Dear Parents:

My sister died leaving behind a disabled child. If you have a child with a disability, the obligation for his or her care continues even after you are gone. My name is Jeff Brody, President of Litigators Incorporated, P.C. Let us help you find out if your child's disability was preventable; you could be entitled to substantial compensation for the lifetime care of your child. You owe it to your child to protect their future. There are time limits, please call me

Litigators Incorporated, P.C. is an Illinois licensed corporation with affiliated law firms throughout the United States

Language Support Success

ABOUT OUR PRODUCTS Prentke Romich Company (PRC) designs, manufacturers and supports augmentative and alternative communication aids. Our products are designed to enable people with disabilities to reach their full potential through effective communication. Our communications devices include AlphaTalker, DeltaTalker, Vanguard, Axs 1600 and the recently introduced Pathfinder plus a full range of computer access tools and accessories.

All of our communications devices utilize Minspeak, one of the most widely used language systems in the field and available exclusively through PRC. Because it is based on the natural structure of language, Minspeak allows users to build and improve their communications capability over time.

MISSION .... to help people with disabilities achieve their potential in educational, vocational and personal pursuits. We accomplish this mission by providing quality language and assistive technology products to people with disabilities, their families and professionals.

UNIQUE ATTRIBUTES PRC is a leader in providing communications solutions for one simple reason. We define our success by the success of our clients. At any gathering of AAC users, people using PRC products stand out as the best communicators. In fact, we have more than 100 people using our devices who regularly serve as "Ambassadors" for PRC by speaking and answering questions at national and regional conferences.

We also recognize that communications is a very human endeavor so our commitment to your success extends beyond providing the best technology and language systems. We maintain a national network of consultants, speech and language experts, who can help you select and learn to use the right AAC products. We provide equipment for rental or trial use, customer service support, technical support and assistance in obtaining funding for our products. And today, we are a leader in providing online information and training services to make our products affordable and accessible.

Parent to Parent Programs

Parent to Parent (P-P) programs provide informational and emotional support to parents who have a child, adolescent or adult family member with special needs. P-P programs offer an important connection for a parent who is seeking support for a specific disability issue, by matching him or her with a trained "veteran" parent who has already "been there." Because the two parents share so many common concerns and interests, the support given and received is often uniquely meaningful. Such one-to-one relationships provide more intimate and individualized support than can be found in most traditional parent support groups.

P-P programs have been providing one-to-one matches for more than 25 years. The major components are screening and training of veteran parents, careful matches based on family and disability issues, and follow-up support for each match. Many P-P programs also offer a range of other activities including parent groups for education and support, social events, resource libraries, and services for other family members.

Some states have a Statewide P-P program that offers training and technical assistance to local programs. These Statewide P-P programs often have extensive computerized databases that allow them to make a Statewide match when an appropriate local match cannot be found.

INTERNATIONAL PARENT TO PARENT CONFERENCE

Every other year, parents, P-P program directors, and other professionals in the families and disability field, gather at the International Parent to Parent Conference. The Tenth International Parent to Parent Conference will be held in Reno, Nevada May 5-7, 2000. For further information, please contact: Nevada Parent Network, College of Education/285, Reno, NV 89557-0082; telephone: (775) 784-4921.

USING THIS DIRECTORY

This directory contains P-P programs that provided at least both an address and a telephone number. (Unless indicated, all telephone numbers are for voice only.) Statewide P-P programs have an asterisk (*) by their names, and local programs that are affiliated with the Statewide program are not listed seperately, and gave EXCEPTIONAL PARENT magazine permission for contact information to be included in the EXCEPTIONAL PARENT *Resource Guide*. If you are looking for a local program in a state that has a Statewide program, please contact the Statewide program for contact information. If you do not find a local program in your community, or if you wish to add or make revisions to this list, please contact the Beach Center on Families and Disability, 3111 Haworth Hall, University of Kansas, Lawrence, KS 66045; telephone: (785) 864-7600 (voice/TDD); fax: (785) 864-7605.

When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

Berkshire Meadows

Nestled in the serene beauty of Western Massachusetts' Berkshire Hills, Berkshire Meadows offers a comprehensive, integrated year-round residential program for children, adolescents and young adults who are severely developmentally delayed and may be multiply disabled.

We help our population become more independent, more self-sufficient and empowered. For their families we strive to offer education, encouragement, and support. We believe that all people, no matter how severe their disabilities, should be given the opportunity to achieve their maximum potential.

Discover
New England Village

Where adults with mental retardation lead fulfilling, enriched lives.

When our parent founders established New England village as a private nonprofit corporation in 1966, they had a vision of something better for their children... a warm, caring stable and secure environment where young adults with mental retardation can lead a high quality lifestyle with opportunities for growth and friendship.

Discover the quality of life enjoyed by New England Village residents. Our campus, set on 80 beautifully wooded acres just 25 miles south of Boston, offers attractive contemporary style homes and townhouse apartments. Learn about our full range of residential options, extensive vocational and education programs, and wide spectrum of recreation and social opportunities. We invite you to meet our dedicated and caring staff and speak to other families about our village.

Call (781) 293-5461, or write Judy Andracchio, Admissions Coordinator, to arrange your personal visit or request our brochure and video presentation. We invite private and state-sponsored referrals.

NIH STUDY
SUBJECT RECRUITMENT
CHILDREN WITH CEREBRAL PALSY

The Human Performance Laboratory at Barnes-Jewish and St. Louis Children's Hospitals in St. Louis, Missouri, is seeking children with cerebral palsy (CP) to serve as controls for an NIH-FUNDED research project.

WHO: Children with spastic diplegia CP must be 4 to 25 years of age and ambulating independently, or with crutches or canes (orthotics are acceptable).

PURPOSES: To study the effectiveness of the selective dorsal rhizotomy (SDR) surgical procedure and develop an objective method to help select candidates.

METHODS: Four groups of children are being recruited.

Group 1 will undergo the SDR and have intensive physical therapy (PT).
Group 2 will not undergo the SDR but will have intensive PT.
Group 3 will not undergo the SDR and will continue with their current PT.
Group 4 will be children with able bodies.

We are currently recruiting children for Groups 2 and 3. No surgery will be performed on these children. Children who are randomly assigned to the Group 2 will have intensive PT (3-4 times/week) in their hometown paid by the grant. Children will be tested 4 times over a 22 month period. Tests will include an analysis of gait, strength and spasticity (ankle, knee, hip), oxygen uptake, gross motor function measure (GMFM) and disability questionnaire. All tests will be paid by the grant. Substantial participation incentives are provided to offset patient expenses and minimize attrition.

For more information please contact:

We can help with custom solutions

Transport your child safely & securely

◄ **The ADJUSTABLE E-Z-ON™ VEST** is a dynamically-tested safety restraint designed for any kind of physical or behavioral need. The Adjustable E-Z-ON™ Vest grows with the child and adapts to seasonal clothing. Used with our mounting straps, it is easily installed in any family vehicle, bus, or wheelchair. Available in 4 sizes to fit toddlers through adults. Accessories are available for children who lack control over their movement.

The MODIFIED E-Z-ON™ VEST ►

Children with certain physical conditions (body cast, long leg cast or hip spica) have to ride in a prone or supine position. The new modified E-Z-ON™ VEST (Model #101M-2) enables these children to be transported securely. No special installation is required...the Modified E-Z-ON™ VEST adapts to the vehicle's existing seat belts.

Sally, 40 lbs. and 45" tall, in the #8600 Reclining Bath Chair with #8875 Head Pad

Sharing the Caring

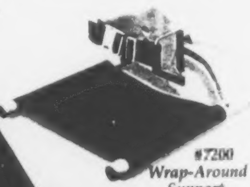
Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

■ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

#5800 Hi-Back Positioning Commode for junior adults

■ At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child – and you – to enjoy the bath.



#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

■ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.

#2000 Car Seat

Why do these products work so well?
Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

NEW
IMPROVED
QUICK-MIX FORMULA
DISSOLVES INSTANTLY, NO LUMPING.

To Life!

DIAFOODS THICK-IT brings the joy of eating back to people with swallowing problems.

Here's the solution for the millions of young and old who need modified consistencies to enjoy eating.

DIAFOODS THICK-IT, when mixed with hot or cold, thick or thin liquids and pureed foods, produces any desired consistency quickly, easily and controllably. But it does not change the taste or appearance of the food it thickens.

DIAFOODS THICK-IT adds sixteen calories per tablespoon for nourishment but is very low in sodium for people on sodium restricted diets. And it helps hydrate patients because it will not bind water or fluids.

DIAFOODS THICK-IT is the market-maker and the #1 selling brand of Instant Food Thickener. It is recommended by speech and language pathologists, dietitians and nutritionists in hospitals, nursing homes and rehabilitation facilities across the country.

For product literature and advice, a free sample and information where **DIAFOODS THICK-IT** may be purchased, **call**... (800) 333-0003.

Free educational material, call... (800) 333-0003.

The booklet "Dysphagia, A Review For Health Professionals" discusses causes, evaluation and treatment of dyspagia.

The pamphlet "Swallowing Problems" helps patients and caregivers understand and adapt to dysphagia.

Mental Health Resources

Special help is available, in some states, for families with children and adolescents, who have serious emotional disturbances, through projects funded by the Center for Mental Health Services within the Federal Substance Abuse and Mental Health Services Administration. These projects were created with the vision of providing services for individuals through "systems of care:" community-based, comprehensive, coordinated, flexible, family-centered, and culturally competent.

These support projects are designed to help family-controlled, not-for-profit, private-sector organizations build and maintain networks of family members and others who are responsible for services to children and adolescents with serious emotional disturbances as well as their families. The projects assist individual families through information, referrals, and other support. In addition, they educate service providers, policy makers, and other interested parties about the needs of these children, adolescents, and families.

This directory includes the addresses and phone numbers of these projects. When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

BEST COPY AVAILABLE

University Affiliated Programs

Authorized by Federal legislation to help states and local communities respond to the needs of people with developmental disabilities and their families, University Affiliated Programs (UAPs) serve as a liaison between the academic world and the developmental disabilities service delivery system. UAPs network with and provide assistance to State Agencies, their local affiliates, and to various nongovernmental consumer-based organizations.

Most UAPs provide direct clinical, educational, and other services to individuals and families, or can assist families in finding services. UAP Mental Retardation/Developmental Disabilities Research Centers, indicated by an (R) following the center name, are also included in this directory even though they may not provide direct services. These centers develop essential knowledge and information upon which to base new and improved treatments, supports, and services. Some of these research centers are housed at the same academic settings as the UAPs providing direct services.

These listings were provided by the American Association of University Affiliated Programs for Persons with Developmental Disabilities, 8630 Fenton St., Ste. 410, Silver Spring, MD 20910; telephone: (301) 588-8252 (voice); (301) 588-3319 (TDD);
fax: (301) 588-2842. Web site: http://www.aauap.org

Circle #55

Alliance for Technology Access Centers

The Alliance for Technology Access (ATA) began in 1987 as a joint project of a grass-roots organization, the Disabled Children's Computer Group, and a major corporation, Apple Computer™. From this small group of parents, consumers, and professionals, the ATA has grown into one of the nation's largest resources to help children and adults who have disabilities, gain access to the benefits of adaptive technology.

The ATA's most important means of promoting technology access may be its nationwide network of community-based assistive technology resource centers. ATA centers work with a wide variety of individuals and organizations and have no eligibility criteria for determining who may receive service. Most centers provide hands-on consultations, product demonstrations, make recommendations and referrals, and present workshops on technology use.

This listing was provided by the ATA (for the main office, see first listing below). When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

It's Simple.

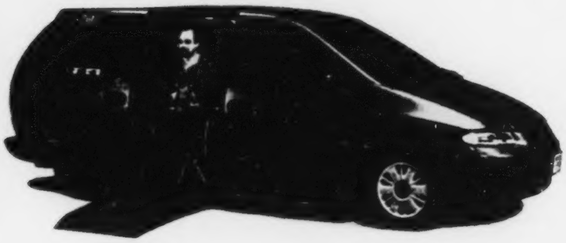
You want to get out and enjoy life.

At Braun, we don't think that's too much to ask. That's why for over 25 years we have designed mobility systems that are as dependable as they are easy to use. Want to find out more?

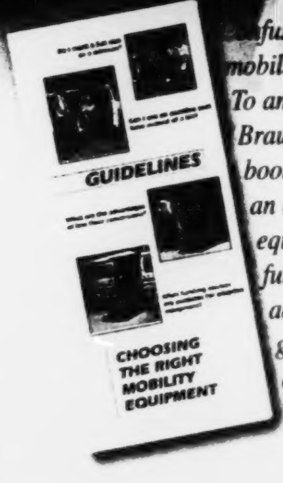
Just call 1-800-THE LIFT.

We'll be happy to send you more information, and we'll also put you in touch with the Braun All-Star Distributor nearest you.

It's as simple as that.



The 1998 Braun Entervan®



Confused about which mobility equipment you need? To answer your questions, Braun has published a helpful booklet entitled "Guidelines," an excellent resource for equipment selection and funding sources. Major adapted vehicle rebate programs are also listed. Simply call 1-800-THE LIFT for your free copy.

A *dynamic breakthrough in digitized speech.*

Thank You
Memory
Cool!
Battery
Hi!
Goodbye!
Yes
No way!
Excuse me
No

The new Dynamo Digitized Speech Device is simplicity itself. It breaks through the barriers of cost and complexity to give a whole new generation of users a chance to be heard. With its small, rugged case and a weight of just under 1.8 pounds, the new Dynamo Digitized Speech Device redefines digitized speech. The dynamic display eliminates the need for paper overlays. Scanning can be done with a single switch. Extra-long recording time allows more speech in any language. And communicators can enjoy greater independence through its infrared control.

The new Dynamo Digitized Speech Device is also a simple and economical diagnostic tool for cognitive abilities of children and seniors. Since it uses a similar menu system to DynaVox, the new Dynamo makes it easy to progress to other DynaVox communication solutions. And Dynamo is backed by DynaVox Systems, the world's leading provider of advanced augmentative communication solutions.

For more information on the new Dynamo Digitized Speech Device, call DynaVox Systems at **888-697-7332**.

Assistive Technology Consortium

The NJ Consortium to Access-Abilities provides a non-competitive network of communication and support for:

- teachers,
- students, and
- families.

The Consortium also serves as a resource which provides services in

- assistive computer technology and
- augmentative communication.

The following list contains the names, areas of expertise, and e-mail addresses of consortium members. E-mails are indicated by the symbol, ✉. Parents can contact any of these individuals for more information on services in assistive computer technology and augmentative communication.

The NJ Consortium to Access-Abilities is hosting a conference in March, 2000. See *Exceptional Parent* February 2000 for more details.

NOTES:

Adaptive Recreation Organization

This directory includes national organizations offering adaptive sports and recreational activities for people of many abilities. In addition to providing a variety of opportunities for fun and social interaction, some of the listed organizations offer support groups as well. Most of the organizations have local chapters, or they can do referrals to other local organizations which offer similar activities.

USING THIS DIRECTORY
A description of services provided by individual groups follows each listing in this directory. Numbers correspond to items listed in the **Key to Services**. When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

NOTES:

NFADB

National Family Association for Deaf-Blind
is a non-profit, volunteer-based family association. Our philosophy is that *individuals who are deaf-blind are valued members of society and are entitled to the same opportunities and choices as other members of the community.*

NFADB is the largest national network of families focusing on issues surrounding deaf-blindness. Using a team of eleven Regional Directors and an Executive Committee, we advocate for all persons who are deaf-blind of any age and cognitive ability. We publish a tri-annual newsletter; support national policies to benefit people who are deaf-blind; collaborate with professionals; work with national projects; and maintain a website with a chatroom and listserv for members.

For more information or to contact your Regional Director:

Accredited by Joint Commission on Accreditation of Healthcare Organizations

Circle #95

Children's Hospitals

The National Association of Children's Hospitals and Related Institutions is a national organization of children's hospitals and represents hospitals in the United States, Canada, Mexico, Puerto Rico, and Singapore. NACHRI promotes the health and well-being of children and their families through support of children's hospitals and health systems that are committed to excellence in providing healthcare to children. It does so through education, research, health promotion, and advocacy. NACHRI's 161 member institutions work to ensure children's access to healthcare and the continuing ability of children's hospitals to provide services needed by children.

This listing includes NACHRI **members**, **associates**, and **supporters**. NACHRI members comprise freestanding children's hospitals, children's hospitals within hospitals, and specialty hospitals. The **specialty** children's hospitals provide clinical specialization in • orthopedics, • rehabilitation, • chronic diseases, or • psychiatry. One of the specialty hospitals, Texas Scottish Rite Hospital for Children in Dallas, Texas is supported by private donations and does not bill for services. The hospital specializes in pediatric orthopedics and learning disabilities and treats children who meet its Texas residency requirements. • A group comprised of 22 **Shriners children's hospitals** is also a NACHRI member; these hospitals specialize in orthopedics and burn treatment and provide their very expensive treatments free of charge.

For more information about NACHRI children's hospitals, visit the NACHRI Web site at http://www.childrenshospitals.net/nachri. Direct links are available to most members listed under "About NACHR." For more information about NACHRI contact member services at NACHRI, 401 Wythe Street, Alexandria, VA 22314; telephone: (703) 684-1355; fax: (703) 684-1589; e-mail: lbaldwin@nachri.org.

IN EVERY ISSUE

EXCEPTIONAL PARENT'S "Search and Respond" column affords parents, caregivers, and professionals the opportunity to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. We try to print as many Search and Respond letters as possible in each issue and on our Web site: **www.eparent.com**. You can write, fax, or e-mail your letters to: EXCEPTIONAL PARENT magazine, 555 Kinderkamack Road, Oradell, NJ, 07649; fax: (201) 634-6570; e-mail: epedit@aol.com; or visit www.eparent.com on the Web and click on "Search and Respond" which is located on the homepage. It is important to indicate whether the letter being sent is a "Search" or a "Respond." When sending a "Respond," please indicate the title, initials, month, and year of the "Search" letter you are answering. All responses are also forwarded to the writers of the "Search" letters, and most are published. Due to spacing issues, all letters may be edited. (As with all matters concerning medical care and advice, individuals are also expected to consult the appropriate professionals regarding care.)

Developmental Disabilities Councils

Developmental Disability Councils, under the Developmental Disability Assistance and Bill of Rights Act (DDBRA) of 1994, are responsible for allocating funds for services and supports for people with developmental disabilities. There is one in each state and their function is to enable individuals to have the opportunity to make choices regarding their quality of life and to be included in the community. For more information on legislation and you or your child's rights under the DDBRA in your state, contact the federal government's **Administration on Developmental Disabilities Administration for Children and Families U.S. Dept. of Health and Human Services**, Mail Stop: HHH 300-F, 370 L'Enfant Promenade, SW, Washington, D.C. 20447; Tel: (202) 690-6590; Web site: http://www.acf.dhhs.gov; E-mail: add@acf.dhhs.gov. Below is a state-wide list.When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

Title V Program Contacts

Every state has a Title V Program which is funded, in part, through the Federal Title V Block Grant that provides health-related services to children with special healthcare needs—sometimes abbreviated as "CSHCN"—and their families. Title V Programs also provide assistance in accessing other services that CSHCN and their families need, such as parent support and information networks. The financial eligibility criteria, residency criteria, and medical eligibility criteria for these Programs varies from state to state. These Programs are also known by different names in different states. The following is a list of contacts in each of the state Title V CSHCN Programs. The listing is based on the *Directory of State Title V CSHCN Programs: Eligibility and Scope of Services*. This report was developed by the Institute for Child Health Policy in Gainesville, FL, with financial support from the Maternal and Child Health Bureau, (US Department of Health and Human Services) and with technical assistance from the Association of Maternal and Child Health Programs. The information contained in this report is also available through the Internet. The address on the World Wide Web is **http://www.ichp.edu.**

USING THIS DIRECTORY
When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

Thanks to the Courage, Determination and Pioneering Spirit of Patients and their Families

Vagus Nerve Stimulation (VNS™)

is the first new FDA approved non-pharmacological treatment for partial seizures in 100 years.

On July 16, 1997, VNS was approved by the FDA "for use as an adjunctive therapy in reducing the frequency of seizures in adults and adolescents over 12 years of age with partial onset seizures which are refractory to antiepileptic medications." Since then, over 4,000 patients and their families have shared in the Cyberonics Oppportunity.

For more information on VNS:

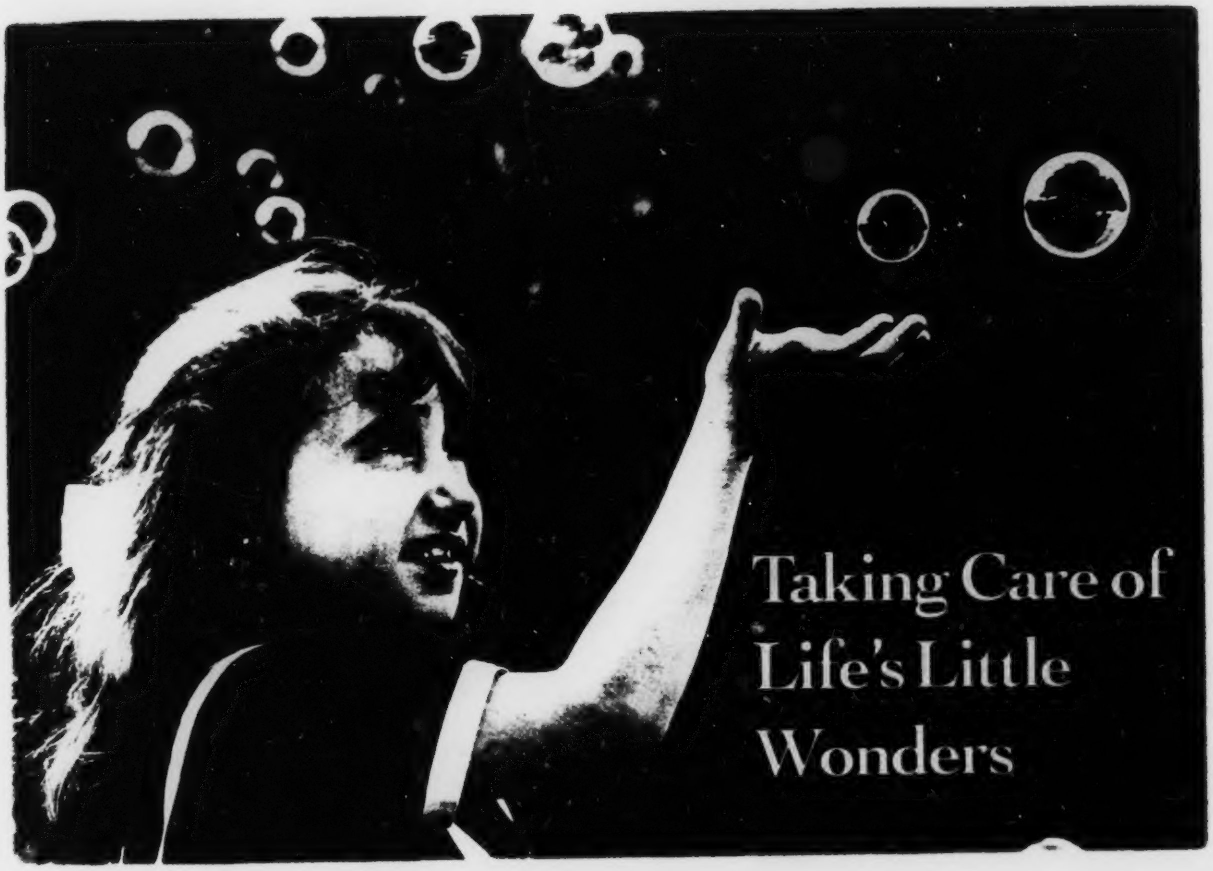
DEVICES FOR EPILEPSY

Circle #42



At Children's Hospital, we know what it takes to work wonders in the care of a child. For 80 years, we've provided pediatric care with a philosophy that has remained unchanged – we believe in not only improving the health of our patients, but in enhancing the quality of their lives. As one of the Southeast's largest providers of specialized pediatric services, we take an interdisciplinary approach to treatment, delivering family-centered care through a variety of programs:

- Our **Pediatric Rehabilitation Program** offers inpatient and outpatient services at several locations with customized treatment plans to help each child reach full functional potential.

- Opened in 1999, our **Transitional Care Unit** provides subacute care with active participation of families and goal of transition to home.

- Our **Pediatric Orthopaedic Program** provides services ranging from inpatient surgery to outpatient care – always incorporating the unique needs of each child.

- Our **Assistive Technology Program** offers evaluation and training on the newest augmentative communication devices and daily living aids.

- We have **32 Specialty Clinics** for children with chronic conditions as well as innovative programs like our **Pediatric Feeding Disorders Program** and the **Neurosciences Center for Children.**

At Children's Hospital we understand that quality health care takes more than expertise. It takes vision. And compassion. With this in mind, we are continually expanding our resources to provide for the special needs of all children. Because *every* child is a wonderful gift.

FAX (978) 448-9695
TTY (978) 448-5541

A subsidiary of
Children's Medical Center

These are descriptions of Children's Extended Care Center (CECC), which provides comprehensive health care, therapy and education in a residential setting for children with complex medical and developmental needs.

But it's the little things that make all the difference.

"The staff show such devotion to the kids," says a parent whose 11-year-old son is a resident at CECC. "I don't know how they do it. Even little things never get overlooked, like keeping chapstick on hand for Matt's lips."

All staff members at CECC—from nurses to teachers to administrators to groundskeepers—extend extraordinary care to children everyday, in countless small ways. They know who enjoys hustle and bustle, who prefers peace and quiet. They remember to open a window to let in a spring breeze, or to choose flowers both for appearance and fragrance. Every wheelchair has a handwritten card on the back, alerting staff to that resident's likes and dislikes.

Located in Groton, Mass., CECC admits and offers short-term and long-term care to children from birth to age 22. All services are tailored to the needs of each child and family. In addition to receiving skilled nursing care, children participate in a school program, where an integrated curriculum matches activities with abilities.

Through the "Into the Community" program, CECC residents mix with the neighboring community and members of the community join activities at CECC. Several CECC residents attend nearby public schools for a few hours a week accompanied by a CECC staff member.

A subsidiary of Children's Medical Center, CECC is housed in a cheerful, two-story building in a residential neighborhood. The grounds include a large outdoor play area, gardens, and a swimming pool, allowing residents and visitors to enjoy a variety of outdoor activities.

Guide to Theme &

Amusement parks are synonymous with family fun and excitement. In order to ensure that visiting one of these parks is a pleasant experience for their child with a disability, parents need to know the accessibility features of the park before planning a trip. Below, we have provided a state-by-state listing of amusement and theme parks that participated in our accessibility survey. Any special services are listed at the bottom of each entry and a Key to Services is provided on every other page to help you find the park that will let your child have the most fun with the least difficulty.

ALABAMA

Southern Adventures
2150 Leeman Ferry Circle

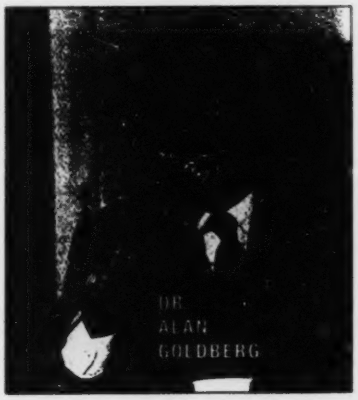
EXCEPTIONAL PARENT'S *Exceptional People Awards*

Everyone knows someone who is exceptional in some way. We think it is fitting to honor those people who have influenced positive change in the lives of people with disabilities as an "Exceptional Person." Featured here are this year's honorees. Starting in 2000, we invite our readers to submit their nominations for Exceptional People to us for recognition throughout the year. Please send them to us at Exceptional Parent Magazine, 555 Kinderkamack Rd., Oradell, NJ 07649-1517, fax: (201) 634-6570; or e-mail epedit@aol.com.

We thank every one who participated and we especially thank those Exceptional People featured here for serving as an inspiration to everyone.

—The EP Staff



ALAN GOLDBERG

Nominated by Paul Dulle,
Executive Director,
United Cerebral Palsy of Greater Chicago

Dr. Alan Goldberg is a dad who has been an active volunteer in the movement to ensure disability rights and services. Alan has two girls, Melissa, 7, and Sarah, 11, who has cerebral palsy. As a member of his local school district's strategic planning committee, Alan helped secure the committee's input in the design of the district's special needs programming. He also worked to establish a support group for parents.

Alan has been an active board member of United Cerebral Palsy of Greater Chicago, Board President of United Cerebral Palsy of Illinois, as well as a member of the national policy-setting committee of the United Cerebral Palsy Associations. He is a Fellow of the Volunteer Leadership Institute, as well as co-chair of the Finance Committee of the Illinois Interagency Council on Early Intervention. Alan has also been appointed by the Governor to serve as chairperson of the Illinois Planning Council on Developmental Disabilities. In addition, he is a member of the New Trier Township Committee on Disabilities and a member of the Attorney General's Special Education Advisory Committee.

Thanks to the perseverance and patience of his wife, Beth, he has the time to engage in all of these community activities. Beth and Alan are deeply committed to advancing the rights and services of children and adults with disabilities.

For his personal commitment, selfless giving, and tireless dedication to the mission we all serve, Alan Goldberg is a stellar example to us all.

MICHAEL AND ANDREA GORDON

Nominated by Brookes Y. Gordon, age 16
of Lakeland, Florida

When I was 8 months old, I was diagnosed with a rare neuromuscular disease called Werdnig-Hoffman syndrome (characterized by progressive muscular weakness and atrophy). My mom and dad have gone to extreme measures to provide the most comfortable life possible for me. They are always very positive about everything, and that has helped me to just have a positive outlook on life itself. A couple of times I have had life-threatening bouts with pneumonia—actually, I was real close to death. Through all the sickness, hospital stays, and special medical needs, I could always rely on my parents. They have taught me many important life lessons. No matter how much the bills were getting behind, they still never left my side.

Although my medical needs have always been top priority for my parents, I have other wants and desires that they have met for me as well. I am a big fan of the rhythm and blues group, TLC. I went to my first TLC concert in 1993, and when I told my dad that I wanted to meet them, he managed to get me a backstage ticket. Later on that year, my parents filled out an application for The Children's Wish Foundation for me to meet and spend time with the group. My mom followed up with phone calls and two years later, my dream became reality. I was able to spend over ten hours with TLC!

Just a few months ago, my parents took me on a spur-of-the-moment trip to attend a TLC press conference in Atlanta. We usually don't do last minute things, because my medical equipment is essential, and if we forget something I could get into distress, but my parents were determined to give me this thrill.

Without having supportive parents and God, none of my desires and goals would have ever happened. I'm a big thinker, and I'm really up for challenges, so when someone doubts me, I just have to prove them wrong. This strength and determination comes from my parents always telling me that no matter what my physical limitations are, I can still achieve what ever I put my mind to. My parents, Michael and Andrea Gordon, are the true definition of EXCEPTIONAL parents.

MIKE BELLANTONI AND HIS SON ANTHONY SHOOT SOME HOOPS.

MIKE BELLANTONI

Nominated by Gail O. Olive

United Cerebral Palsy of Northeast Pennsylvania

After sustaining a life-altering spinal cord injury and completing physical rehabilitation at Allied Services, in Scranton, Pennsylvania, Mike Bellantoni moved his family to northeastern Pennsylvania and took a job as the Wheelchair Sports Coordinator for Allied Services.

Being able to participate in wheelchair sports basketball and tennis have played a crucial role in Mike's own rehabilitation and adjustment to a new lifestyle. Mike has also brought wheelchair tennis to the community, and has been instrumental in helping the Allied Forces wheelchair basketball team with their game. In addition he has also introduced a wheelchair billiards tournament to the Scranton area.

For the last nine years, Mike and his wife Betty have helped organize and run the Challenger Division Little League, a youth baseball program for children with disabilities that reaches more than 100 children. The success of the program inspired Mike and Betty to develop an innovative, indoor, adaptive soccer program at Penn State University's Worthington Campus.

The Bellantonis also started the Adaptive Sports and Recreation Foundation, and coordinated many events to raise funds and increase awareness for recreation opportunities for individuals with disabilities.

Mike serves as Board President of the Center for Independent Living. Betty serves on the Board of Directors of United Cerebral Palsy of Northeast Pennsylvania and is also the Parent-Teacher Association President at Abington Heights Middle School, Clarks Summit, Pennsylvania. Mike and Betty's son, Anthony, 11 has also gotten involved with the Challenger baseball and indoor soccer program as a "buddy."

The Deutsch Institute, a non-profit organization promoting recreational sports and pursuits for people with disabilities, honored Mike by inducting him into their Wall of Fame in 1997. Mike was also the recipient of the first Edie Ransom Award, given by the Pennsylvania Coalition for Disabilities, recognizing those who break down physical and attitudinal barriers to people with disabilities.

PATTY SPROFERA

Nominated by Linda Tempel, United Cerebral Palsy of New York City (UCP/NYC)

Born prematurely, weighing in at just 17 ounces, Patricia ("Patty") Sprofera's survival was truly a miracle. It was soon discovered that Patty had cerebral palsy, a condition that would impact her life in many ways.

After living in Germany and undergoing surgeries there, Patty returned to the US and attended New York City's first public school elementary program for children with cerebral palsy at PS 135. This also began Patty's association with UCP/NYC, the organization that would play a continuing role in her life. In 1953, she was chosen as one of three national poster children for UCP and made numerous guest appearances in that capacity.

In 1971, Patty began working with UCP/NYC as an administrative assistant in the School Division. Patty honed her listening and referral skills by assisting parents, caregivers, and agency providers. Referred to as "Colombo" (after the TV detective) by many of her colleagues, Patty had a reputation for tracking down the information that people needed and directing them to the proper resources.

After ten years, Patty moved to the staff-training department where she assisted other staff. She was forced to take a leave of absence from UCP/NYC a year later, when she underwent two spinal fusions. Told by her surgeon that she would never walk or work again, Patty defied both the odds and conventional wisdom. After spending nearly three years in body casts and having temporarily lost the use of her arms, Patty emerged victorious. She returned to work in the fall of 1986, and shortly thereafter, began working full-time in the Family Support Services department, returning to her duties at both the typewriter and phone. Patty notes, "I am happy to say that I still know what is most important and always will be—assisting families, caregivers and agencies and providing quality information to all callers." She adds, "Many people were in my corner. I truly know the meaning of 'giving back' and I am happy to do that every working day."

PATTY SPROFERA (LEFT) RECEIVES THE UCP SERVICE AWARD FROM THOMAS MAUL.

Perhaps the highlight of Patty's career came on June 17, 1997 when she was honored as an "outstanding employee" before 1,200 guests at UCP/NYC's 50th Anniversary celebration.

Over the years, many people have written letters of thanks to Patty, acknowledging her efforts on their behalf. From government and school officials to family members seeking help, the praise comes in many forms and includes words like "helpful," "superb," "diligent," "professional," and "refreshing." One mother wrote, "I couldn't believe it. She cut through all the red tape. I finally felt I had someone with an answer to my problems."

Patty is not only an inspiring role model for individuals with disabilities, she is also a woman of incredible integrity, courage, and perseverance who is a friend to many

JOSEPH PEREZ

JOSEPH PEREZ

Nominated by Catherine Hendrickson

Project Director, Day Habilitation

United Cerebral Palsy of New York City (UCP/NYC)

Joseph (Joey) Perez is 38 years old and has attended United Cerebral Palsy of New York City (UCP/NYC) for 12 years. During that time, he has exhibited impressive growth in many areas of his life.

In 1994, Joey became active in the New York State Self Advocacy Association at the NYC level. Because he did not travel independently, he found it very difficult to attend meetings that were held all over the city.

A fellow self-advocate leader, Tony Phillips, taught Joey to travel independently using city buses, Access-a-Ride and ambulette. He now travels from his home in upper Manhattan to the program in lower Manhattan, to meetings in Brooklyn and other boroughs, and by train to Albany.

His commitment to the Self Advocacy Association has deepened to the extent that in 1996, he was elected to the New York State Self Advocacy Association's board.

Joey's major advocacy project has been to improve the quality of service of Access-a-Ride, which has led him to speak at city hearings, write letters to the Manhattan Transit Authority (MTA) and help develop pick-up procedures. In addition, he has been active in motivating MTA bus drivers to use courtesy when picking up passengers in wheelchairs.

Although Joey has a very active life, he is always concerned with the well-being of others. UCP/NYC initiated a city-funded Saturday Recreation Program for adults with mental retardation/developmental disabilities. Joey volunteers as an assistant to the program director, helps with administrative tasks, and was proactive in staffing the program from its inception.

Joey is an active friend to many other people with disabilities. He volunteers to help feed participants at programs, and encourages and guides them to advocate for themselves in resolving problems. Joey, who lives with his mother, is also active with his church and uses his advocacy skills for family and neighbors, seeking necessary information and advocating for services such as building repairs.

A hard-working advocate who consistently demonstrates respect for the dignity of all people, Joey Perez is also pursuing challenging personal goals for the future, which illustrate his determination and hopeful spirit.

DARIEN BROOKS

Nominated by Kathy Kittleson

President, Very Special Arts of North Carolina

At age 4, Darien was diagnosed with autism. His disability made it difficult for him to function within his environment. He isolated himself from other people in social settings, expressed no emotional reactions, and made no eye contact. Darien was captivated, however, by reading.

Though they had been advised to have him institutionalized, Darien's parents instead decided that they could work with him. They sought help for their son from TEACCH (Treatment and Education of Autistic and Communication-related Handicapped Children), an agency based at the University of North Carolina at Chapel Hill. For years, Darien and his parents traveled weekly to Chapel Hill. His mother worked with him each night, while his father cared for his brother and sister. When he began school, he received special help from his teachers, who were supervised by the TEACCH staff.

During his childhood, Darien had some impressive accomplishments:

He taught himself to operate a manual typewriter, writing his first stories and book.

He played outfield on his church league baseball team for two years.

He signed up in the fifth grade to play his first musical instrument, a violin.

In 1985, after he graduated from high school, he matriculated at the University of North Carolina at Wilmington. There he studied music and creative writing for nearly three years. Since then, Darien has worked full-time as an office and mail clerk. He still receives services from TEACCH, in their adult program.

Darien represented North Carolina at the Very Special Arts "Art and Soul" Festival in Los Angeles, California. He lives a full life, complete with heartaches as well as highlights.

Now 33, Darien is a published author, and his interests include sports, music, books, and writing. He is nearing completion of his first novel. He has been a member of the Wilmington Symphony Orchestra for 15 years, and sings tenor in his church choir. He corresponds regularly with close friends around the world.

Darien's life is one that has set an example of courage and inspiration for everyone who knows him.

DARIEN BROOKS

... your copy (or copies) of the 2000 Exceptional Parent Resource Guide at just $19.95 each (plus shipping and handling), use the coupon in the Exceptional Parent Library section of this magazine.

ADA Projects

Disability and Business Technical and Assistance Centers

The National Institute on Disability and Rehabilitation Research (NIDRR) of the U.S. Department of Education has established ten regional Disability and Business Technical Assistance Centers (DBTACs) to provide information, training, and technical assistance to employers, people with disabilities, and other entities with responsibilities under the Americans with Disabilities Act (ADA).

The centers act as a "one-stop" central, comprehensive resource on ADA issues in employment, public services, public accommodations, and communications. Each center works closely with local business, disability, governmental, rehabilitation, and other professional networks to provide ADA information and assistance, placing special emphasis on meeting the needs of small businesses. Programs vary in each region, but all centers provide the following:

- Technical Assistance
- Education and Training
- Materials Dissemination
- Information and Referral
- Public Awareness
- Local Capacity Building

Using this directory

Contact the DBTAC's toll-free at: **(800) 949-4232** (voice/TTY). Your call will automatically be routed to the DBTAC in your region.

This list was provided by Adaptive Environments, the New England DBTAC. When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

National Access for Public Schools Project

The National Access for Public Schools Project has also been funded by NIDRR to answer questions about the ADA in public schools. For information, contact Adaptive Environments, Inc., at 374 Congress St., Ste. 301 Boston, MA 02210; (800) 893-1225, Ext.28 (V/TTY). Colleges and Universities for Students with Learning Disabilities

The selection of an appropriate college for a student with a learning disability involves the consideration of many factors. It is probably best to focus on two aspects of a school's program: the extent of services offered and the types of services available.

The extent of services describes the amount or level of help offered. Programs range from minimal to extremely comprehensive.

- A minimal support program is one that reacts to student requests, but does not anticipate their needs. Such a program is appropriate for an independent self-advocate who knows what he or she needs and can request it.
- The next type of program is a moderate support program. This type offers additional features, such as learning strategies instruction, counseling, and content tutoring. There is usually a learning disability specialist available to advise students. This type of program is good for students who want a mainstream environment, but need specific support.
- A fully integrated, comprehensive program is typified by a coordinated array of services offered to each student at enrollment. Services address psychological, academic, and social needs. Students are often required to participate in specific parts of the program.
- A comprehensive program may benefit a student who has difficulty anticipating needs, or who wants a more structured environment.

Type of service refers to the philosophy that governs the program. Types of services include:

- remedial,
- psychoeducational, or
- compensatory.

Remedial services focus on re-learning needed academic skills, placing emphasis on solidifying basic skills. Psychoeducational services concentrate on counseling and using social/emotional support as a supplement to academic assistance.

Compensatory services teach coping techniques and strategies to help students work "around" their disabilities and find effective academic alternatives—Excerpted from "Striking the Match," by Georgeann duChossois, EdM EP, September 1999, p.77.

The following is a subjective list but by no means an exhaustive one, of college programs categorized by type and extent of services for students with learning disabilities. These categories are mostly a continuum of services and there is some overlap. This list was compiled by Georgeann duChossois EdM, (as indicated by the red type). Additional entries were provided by Rhoda Cummings, EdD, and Cleborne D. Maddux, PhD (as indicated by the blue type).

Georgeann duChossois, EdM, is in private practice in the NY/NJ area. She specializes in college advisement and learning disabilities assessments for adolescents and adults. She can be contacted via e-mail at duchossois@earthlink.net.

Rhoda Cummings PhD is Professor of Counseling and Educational Psychology at the University of Nevada, Reno and the mother of a son with learning disabilities.

Cleborne D. Maddux, PhD is Professor of Counseling and Educational Psychology at the University of Nevada, Reno. He received his doctorate in learning disabilities at the University of Arizona.

EXTENT OF SERVICES

Comprehensive—maximum level of support usually characterized by an integrated program of services in which all students participate—sort of a package deal for the students.

Spring Time by Amy Neubauer

The Joy of Independence

The joy of self-expression shines every day for students at Crotched Mountain Rehabilitation Center. Just 50 miles from Boston, surrounded by New England villages and towns, freedom and independence are celebrated with every graduating class. Throughout our progressive 60-year tradition, students have been realizing their dreams and achieving success.

Here, families and their special children find the highest standard of care, education, and treatment. Warm, home-like residences welcome students into a supporting core, from which they explore an exciting world of creativity, expression, and accomplishment, achieved with the help of our dedicated educators and health-care professionals.

Within our state-of-the-art facilities, children master skills of independent living. Our students exercise in the swimming and therapy pools, pursue knowledge using multi-media computers to access the Internet, and develop self-esteem through occupational and vocational training. Students flourish here in the brilliance of success and the joy of independence.

To find out more about the compassionate and caring services we provide for special children throughout the world, please call Debra Flanders in Admissions at 603-547-3311, ext. 235.

ABLEWARE

One Size Fits All–*Not!*

Products designed to accommodate the growth of your child.

Children's Chaise™ Child Seat

F72706-1000 Turquoise $135.00
F72706-1001 Lavender $135.00

Designed as a bath seat, but just as practical in the backyard or living room. Features adjustable straps and a four position headrest to accommodate different sized children, a carrying handle, a holder for a hand-shower, and a soap rest. Can also be purchased with an aluminum carriage with casters to transport children into and out of a shower.

Maddacrawler™ Prone Support Walker

F70409-2000 $249.00

Teaches elementary crawling skills to children with developmental delays and encourages weight bearing on hands and knees. A height adjustable sling provides strength and support. Factory installed casters glide easily on all hard floors and most carpeting. Optional arm attachments transform it into an aid to help children and adults practice ambulatory patterns.

BEST COPY AVAILABLE

Early Intervention Directory

The Individuals with Disabilities Education Act (IDEA) requires all states and territories to provide early intervention and preschool special education for children with disabilities and special healthcare needs. When available, this directory lists these resources for each state or territory:

- Central Directory (**CD**) telephone numbers: For families and professionals seeking information about early intervention and other public and private resources for young children, this number is a good place to start. Many toll-free CD numbers are for in-state use only.
- Chairpersons of Interagency Coordinating Councils (**ICC**): ICCs include representatives of agencies, service providers, and families. Their role is to advise and provide assistance on early intervention programs and, in some states, preschool services as well.
- Coordinators of infant and toddler programs serving children from birth to age three are known as **Part C** programs.
- Coordinators of preschool special education programs (known as **619** programs) serving children from ages three through five.

These listings are provided by the National Early Childhood Technical Assistance Center (NECTAS, Frank Porter Graham Child Development Center, University of North Carolina at Chapel Hill, Ste. 500, 137 E. Franklin St., Chapel Hill, NC 27514; (919) 962-2001; (919) 966-4041 (TTY); (919) 966-7463 (fax) ✉ nectas@unc.edu, and are current as of November 1999. This information is also available on the NECTAS Web site: **http://www.nectas.unc.edu** and is updated on a monthly basis.

Using This Directory

When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

Federal & Federally Funded Information Resources

The federal government supports many clearinghouses, information centers, and institutes that focus on specific topics. In addition to publishing and distributing extensive free material on disability-related subjects, many of the clearinghouses, centers, and institutes also provide referrals to local resources. Staff and funding vary. Because of small staff, several clearinghouses have asked that their phone numbers not be listed; though they are happy to respond to written—and sometimes faxed or e-mailed—requests for information.

For more information on federal and federally-funded information resources, contact:

- **NICHCY** (National Information Center for Children and Youth with Disabilities), PO Box 1492, Washington, DC 20013-1492; (800) 695-0285 (voice, TTY); (202) 884-8441 (fax).
- **NARIC** (National Rehabilitation Information Center), 8455 Colesville Rd., Ste. 935, Silver Spring, MD 20910; (800) 346-2742 (voice), (301) 588-9284 (voice, TTY); (301) 587-1967 (fax).
- **NHIC** (National Health Information Center), PO Box 1133, Washington, DC 20013-1133; (800) 336-4797 (voice); (301) 984-4256 (fax).

When available, World Wide Web site and e-mail addresses have been included. Web sites include the standard **http://** before each address. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

NOTES:

National Information & Advocacy Resources

These national organizations are information and advocacy resources for families and professionals. This directory starts with a listing of organizations providing general information and advocacy, followed by organizations focusing on more specific areas of concern to families of children and young adults who have disabilities.

Numbers following each listing correspond to items listed in the **Key to Services**, which describes services provided by individual organizations.

When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

WE MOVE international Guide to Movement Disorder Organizations and Foundations

WE MOVE is a not-for-profit organization dedicated to providing information, support, and educational materials to people with movement disorders, their advocates, and healthcare professionals. Our goal is to promote awareness of movement disorders for the purpose of early diagnosis, appropriate treatment, and patient support.

This guide provides a comprehensive listing of national, regional, and international support organizations and foundations committed to improving the quality of life for people with movement disorders. It also appears on our Web site. Most of these organizations have established support services with local chapter affiliates for individuals with specific movement disorders and their families. Many provide referrals, publish educational materials, host Web sites, raise funds, and provide grant money for scientific research. These services are identified at the end of each listing and a **key to services** appears on every other page. We are grateful for the contributions from these organizations and we encourage healthcare professionals to actively support them on all levels.

WE MOVE can assist those who wish to establish new organizations where no national group exists. As we learn of other groups and more people seeking ways to help others with movement disorders, this listing continues to expand.

To learn more, contact: WE MOVE, 204 W. 84th St., New York, NY, 10024, USA; telephone: (800) 437-6682; (212) 241-8567 (outside US); or (212) 875-8389; e-mail: wemove@wemove.org; Web site: www.wemove.org.

USING THIS DIRECTORY

When available, World Wide Web sites and e-mail addresses have been included. Web sites are listed with the standard **http://** before each. E-mail addresses are indicated by the symbol, ✉. (Unless otherwise indicated, all telephone numbers are for voice only.)

NOTES:

State Directors of Special Education

Every state has a state education agency that is responsible for general supervision of the state's special education services for children and young adults with disabilities. Within each agency, one individual has the primary responsibility of overseeing these services. Usually, this person is called the State Director of Special Education. This individual—or his or her staff—can direct parents to appropriate local resources; is knowledgeable about the state's procedural safeguard system (the system for handling complaints, mediation, and due process procedures); and can offer other assistance as needed.

The listings in this directory were provided by the National Association of State Directors of Special Education [NASDSE, 1800 Diagonal Rd., Alexandria, VA 22314; (703) 519-3800 (voice); (703) 519-7008 (TTY); (703) 519-3808 (fax)], and are current as of November 1999.

This symbol, ✉, indicates an e-mail address. (Unless otherwise indicated, all telephone numbers are for voice only.)

Safe and Secure on the Web

Pointers on Determining a Web Site's Credibility

by Vanessa B. Ira

With the dawning of the new century, the Internet has become a ubiquitous presence in homes, much like the telephone and TV. What this means for parents and professionals involved in the care of children with disabilities is empowerment made possible by such vast resources of information.

The last year alone has seen a proliferation of Web sites (those focused on disabilities number in the thousands, whether they be sites built for a specific disability association or a health site). How then does one determine which of those sites are credible, and therefore worth revisiting on a regular basis? The following are some pointers to consider in determining the credibility of relevant disability Web sites:

- **When on a Web site, click on the "About Us" or "Contact Us" links or buttons:** These links can give you an idea of who is on the team of people running a particular Web site. Many sites—particularly those that want to prove their credibility—will have a page describing the site's history, background and affiliations in its "About Us" section; It should also include an address, e-mail, or phone number in its "Contact Us" section.
- **Mine the Web's top search engines for additional research:** After you have reviewed any site's background, you can proceed to use search engines for supporting information. This is the exciting part of researching on the Web, where one can gain greater knowledge and perspective through the magic of hyperlinks.
- **Think "Links"**: Sites with good, usable information may have endorsements from prominent special needs organizations and/or have links to other Web sites with more information on the subject. Links to associations that are related to the subject or with educational or even government-supported institutions involved in that subject.
- **Word of mouth:** Ask friends and special needs associations for recommendations on Web sites they think are informative. Remember, you can also use the Internet to e-mail other people you think would be able to clue you in on the credibility of a particular Web site.
- **Content:** Aside from research, a site's credibility is reflected—as with books, magazines, and journals—in its editorial excellence. This means quality of content, down to the cleanliness of the page, which should have very little or no grammatical and typographical errors.
- **Check out how often the site is updated:** A site that is updated regularly with quality content—as some sites do on a daily or weekly basis—is most likely to be run by a team of people who care about its audience. **EP**

Index of New Products

This index of New Products lists all the devices that appeared in the New Products column throughout 1999. The monthly column is compiled by ABLEDATA which maintains a database of assistive technology and rehabilitation equipment. The database contains information on more than 25,000 products for persons of all ages who have a physical, cognitive, or sensory disability. Products are chosen for this page by the ABLEDATA staff based on their specific applicability to or design for children with disabilities. ABLEDATA, operated by Macro International Inc., is funded by the National Institute on Disability and Rehabilitation Research.

For more information on assistive devices or to submit product information for the database contact: ABLEDATA, 8401 Colesville Rd., Ste. 200, Silver Spring, MD 20910; (800) 227-0216 or (301) 608-8998 (voice); (301) 608-8912 (TTY); (301) 608-8958 (fax); Web site: http://www.abledata.com.

For people, by people, about people

The changing climate of healthcare funding creates challenges for children and families trying to access all necessary primary and specialty healthcare services. This Bill of Rights is presented to assist those who participate in assuring access to excellent healthcare services for all children with special healthcare needs and their families.

Recently, 20 family members and professional leaders from the areas of primary and specialty care pediatrics, public policy, and family support met to discuss and define the values, principles, and strategies necessary to affect positive change in the field of specialty healthcare and support services for children with special healthcare needs and their families. The participants represented pediatrics, developmental disabilities, mental health, child welfare, and long-term special healthcare needs.

Following are the values and principles adopted at the gathering:

- **Each child is unique and requires individualized attention in the process of planning, evaluation, and implementation of healthcare services.**
- **Families are assumed to be experts regarding their children and are willing to offer their skills, knowledge, and experience to any healthcare process.**
- **Healthcare for children must be determined by informed family choice.**
- **Partnerships of families and professionals are essential to the delivery of quality health care.**

The following Bill of Rights is a result of these discussions. We hope this Bill of Rights will be considered in all public health policy discussions and be used to influence healthcare policy and financing to assure access to primary and specialty healthcare services for all children with special healthcare needs and their families.

This [illegible] supported by the Institute on Disability/UAP of the University of New Hampshire, Center for Genetics and Child Development, and The Hood Center for Children & Families, Dartmouth Medical School, and Institute for Health Law

Preamble

Over the past decade, effective approaches to support families and children with special healthcare needs have emerged. Today, these family-centered, community-based approaches designed to improve health outcomes are in jeopardy due to the changing funding mechanisms in health care, most notably managed care. Current managed care practices shift decision making from the local level to remote and impersonal organizations, create significant access problems for persons with complex and significant needs, contain inadequate consumer safeguards, and are inconsistent with specialty healthcare needs of children and families. Families in partnership with their physicians and other healthcare providers seek to maintain the gains realized from family-centered and community-based approaches and see continued development of quality health and related support services.

Bill of Rights

All children and families have a right to:

1 Choice among quality family-centered, culturally-sensitive, community-based, comprehensive, and coordinated healthcare services based on the needs of the child and the preferences of the family.

2 Choice among quality child and family-centered mental health and/or behavioral health services and family support.

3 Primary and specialty healthcare services which emphasize typical community-based service options for children.

4 Information regarding the relevant knowledge, skills, and practices of primary and specialty healthcare providers in regard to family-centered services, comprehensive care coordination, culturally competent services, specific childhood medical conditions, and the delivery of and support for community-based services.

5 Timely referral to a choice of specialty healthcare providers based on the needs of the child and without burdensome financial disincentives or authorization processes for families and primary care providers.

6 Assurance of timely communication between the child's primary care provider and all specialty and allied healthcare providers.

7 Family-centered and child-oriented appeal processes for conflict resolution with any insurance company or public funding source.

8 Primary, allied, and specialty healthcare services without the possibility of exclusion from insurance or similar financial support based on a "pre-existing condition," such as the presence of a developmental disability, emotional/behavioral challenge, or other special healthcare need.

9 Primary care providers who are offered incentives, rather than disincentives, to serve children with special healthcare needs.

10 Financing mechanisms (e.g. "capitation rates") that assure access to medically necessary specialty healthcare and related services.

11 Appropriate mileage reimbursement for families who are required by their insurance plan to travel beyond 50 miles to access specialty healthcare services.

Managing with Managed Care Organizations:

A compass for navigating strange new waters.

by Fern R. Potvin

In the course of only a few years, we have seen a rapid transition from traditional fee-for-service medicine to managed care. This shift has forced a complete reorientation in thinking about the healthcare delivery system in the US. Under the fee-for-service system, the insurer was chosen by an employer, a union, or an affinity group such as a professional organization or a college alumni association. Now these same entities pick the managed care organization (MCO), though sometimes the selection of MCOs they can choose among are restricted by state insurance regulations. Individuals, by contrast, are offered only a limited selection—if any—among the final choices.

MAKING SENSE OF IT ALL

Both fee-for-service and managed-care systems establish available benefits and co-payments, and set caps on reimbursement. The two big differences between the old system and the new—the major changes that have engendered so much controversy—are choice and constraints. MCOs specify which primary-care physicians are "approved" providers and then require that they serve as "gatekeepers" who must approve any visits to specialists.

To most consumers these restrictions are just an inconvenience. To people with disabilities and their families, the limits can be a nightmare; they disrupt longstanding and effective patient-physician relationships, eliminate access to specialists, and can result in denial of treatment. "Managed Care and Children with Chronic Illness or Disabilities" by Elizabeth J. Jameson, JD, (Exceptional Parent, September 1999; see box at end of article for order information) examined this situation and offered suggestions to lessen its impact. One useful strategy is to know an MCO's policies and procedures before seeking treatment. This gives the consumer an opportunity to research the most appropriate primary-care physician, for example, or even allow arranging for preapproval of crucial treatments.

Another resource is the National Committee for Quality Assurance (NCQA), which has a wealth of information that can help (see the sidebar on the following page for information on how to contact the NCQA or access their Web site). Created in 1991, the NCQA is a non-profit organization governed by a Board of Directors that includes employers, consumer and labor representatives, health plans, quality experts, health-policy makers, and physicians. Its mission is the establishment of standardized, objective information about MCOs and development of a system of performance measures and accreditation. The accreditation program is voluntary, but almost half the country's MCOs—covering 75 percent of those enrolled in managed care—participate. Qualifications are rigorous; more than 60 different standards, falling into five broad categories, are reviewed during the accreditation process, which also examines member and employer satisfaction with the plan. Here are brief summaries of the five categories:

Access and service: covers general availability of care, including freedom of participating physicians to discuss all available treatment options. Also deals with consumer-reported problems in getting care and how well the plan follows up on grievances.

Qualified Providers: investigates how qualifications of doctors and nurses are assessed, including how often licenses and training are reviewed. Includes consumers' ratings of providers.

Staying Healthy: determines whether the plan helps people maintain good health and avoid illness, stressing preventive care, and whether patients are being given appropriate testing and screening.

Getting Better: outlines how well consumers are cared for when they do become ill, and how new procedures, treatments, and drugs are evaluated for safety and efficacy and then put into practice.

Living with Illness: discusses evaluation and treatment of chronic conditions, and indicates whether the plan has disease-management specialists or teams to assist consumers in

managing conditions such as asthma.

The list of evaluated plans is updated monthly and the results are made available on the 15th of the following month; all plan-specific information shown in this article is from the October 31, 1999 update. When an evaluation is complete, NCQA assigns the plan an accreditation status:

- **Accredited**, **commendable**, or **excellent** indicate that the plan meets, exceeds, or significantly exceeds requirements.
- **Provisional** status means that a plan meets some, but not all, of the standards.
- A plan that has been **denied** accreditation does not meet the requirements.

A current list of plans whose applications for accreditation have been denied is below. If your plan is on this list, tell your benefits manager, union representative, or association membership director **immediately**.

Plans denied NCQA accreditation:
UHP Healthcare, Inglewood, CA HMO
ANTERO Health Plans, Denver, CO HMO
Blue Cross Blue Shield of Delaware, Wilmington, DE HMO/POS Combined
Prudential HealthCare, Tampa Bay, FL HMO/POS Combined
Welborn Health Plans, Evansville, IN HMO/POS Combined

Family Voices State Contact List

The following list of Family Voices State Contacts was provided by Family Voices. Family Voices is a national grass roots clearing-house for information and education about ways to assure and improve healthcare for children with disabilities and chronic conditions. Their network includes families, a volunteer Coordinator in each state, regional Coordinators, and staff. Members of the network serve on local, state, and national boards and task forces; as staff for state health agencies or parent organizations; and as advisors to private and public health systems and research projects. Their mission is to bring the family perspective to policy discussions and decisions. Below are the group's contacts for each state. For the states with no contacts listed, please call the National Family Voices Office at: (888) 835-5669 for information or reach them at :PO Box 769, Algodones, NM 87001; e-mail: kidshealth@familyvoices.org; Web site: http://www.familyvoices.org.

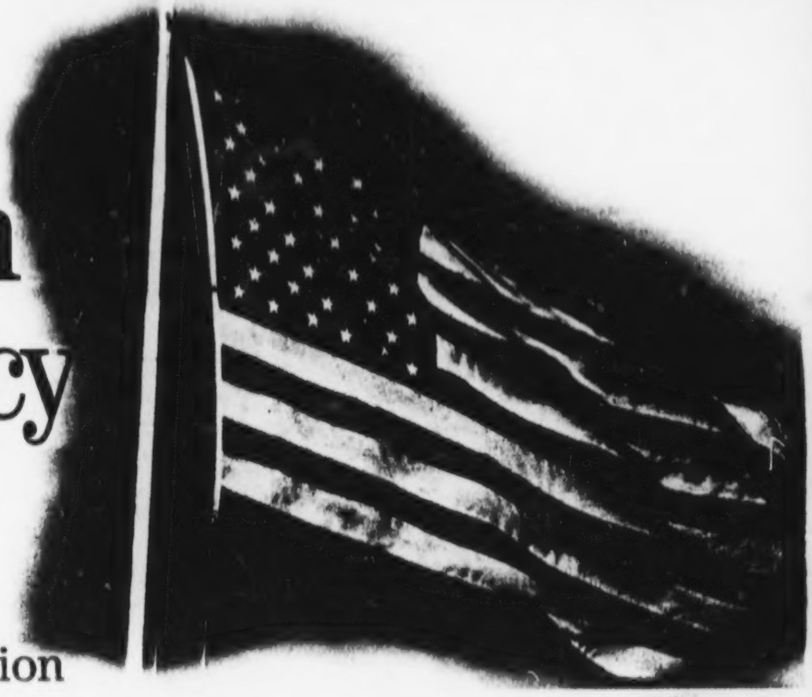
Wishing to meet Garth Brooks, cerebral palsy (via e-mail)	Nov 99	Nov 99

The Protection & Advocacy System:

Offering Special Attention to Special Education



One day, a mom went to pick up her son from school. As she roamed through his classroom, seeing other children laughing and playing, she could not find him. "Where's Scott?" she asked. All eyes went to the six-by-seven-foot grey metal box at the back of the room. Some of the kids in the class giggled, some even laughed outright. As she looked down into the box through the mesh wire that served as the "roof" of the box, she found her son looking up at her.

Scott has a disorder that sometimes causes him to have mild behavior problems. In order to "teach" Scott to behave, his school built this box and put him in it for hours at a time. No one else went into the box when they did not behave. Scott's parents turned to their state's Protection and Advocacy (P&A) office for help.

P&As are federally mandated to provide legally-based advocacy services to people with disabilities in each state and territory. P&As, collectively, are the largest providers of legally-based advocacy services to people with disabilities nationwide. Last year, P&As assisted almost 70,000 individual clients and touched the lives of more than three million people on disability issues.

What happened to Scott? As part of Scott's Individualized Education Program (IEP) that is required under the Individuals with Disabilities Education Act (IDEA), the school was supposed to provide him with a behavior management plan, not a prison. The school argued that the box complied with state law and satisfied their obligation to teach Scott to behave. The P&A convinced the school that it must teach Scott what to do and not just punish him. After much negotiation, the school removed the box. Now when Scott misbehaves, he is punished using the method described in his behavior management plan.

SPECIAL EDUCATION BY THE NUMBERS

Cases similar to that of Scott—ensuring that children with disabilities receive the appropriate services under IDEA — account for nearly 35 percent of P&A cases. Still there is so much more that needs to be done. According to a report by the Office of Special Education Programs (OSEP) in the U.S. Department of Education, many states are still serving children with disabilities in segregated settings (meaning that they learn in classrooms or schools that are separate from children without disabilities). Using the most recent data available, OSEP reported to Congress on how states are doing. For children with disabilities, ages 6 to 11, the U.S. Virgin Islands are serving 75 percent in segregated classrooms and the District of Columbia is serving more than 40 percent the same way. On the flip side, in Vermont, 91 percent of the children are in integrated settings (children with disabilities learn in the same classroom as students without disabilities) and in North Dakota the fugure is 84 percent.

P&As primarily advocate on behalf of special education students through funds from two federal programs - Protection and Advocacy for People with Developmental Disabilities (PADD) and Protection and Advocacy for Individual Rights (PAIR). These two programs join two other programs - Protection and Advocacy for Individuals with Mental Illness (PAIMI) and the Client Assistance Program (CAP) - to complete the entire P&A System.

THE LIVES WE TOUCH

In Wichita, Kansas the school board voted to cut the funds for speech and occupational therapy (OT) programs. That meant 200 students who had been receiving speech and OT at school to help them with their school work (many also received services outside of school), could no longer receive these services. They would fall farther behind their classmates each year. The P&A stopped the school board by filing two class action lawsuits in May, 1997. Shortly after the lawsuits were filed, the district reinstated the speech and OT programs. The cases settled in October, 1997, with an agreement by the school district to offer services during the summer to the students whose services were cut.

Aaron, a young child in Wyoming, lives with foster parents who make all of the everyday decisions for him that parents ordinarily make. The school district insisted that it had the right to select a separate parent surrogate to make decisions about Aaron's educational program, and filed an action in court requesting to enforce that right. If the school district had won, Aaron's foster parents would have had no say in decisions about what kind of school he would attend, what types of teachers and services he would have, etc. The P&A advocated for Aaron's foster parents to be involved in decisions about his education. After a hearing, the Court held that the child's needs take precedence over the school district's interpretation of state education rules and regulations. The court also decided that whether a foster parent may serve as the parent of the child for purposes of planning his educational program is a determination to be made on a case by case basis. Now, Aaron's foster parents can decide what's best for Aaron at school.

In Arizona, the school district had a policy of ending all educational services for certain students with disabilities who had been expelled from school, despite the fact that the law clearly states that this is illegal. No child who is eligible for special education may be completely cut off from an education. The P&A filed a lawsuit in federal court, challenging the school district's policy. The court ruled that the school district's policy violated the IDEA, a federal special education law. The judge found that services for students who are suspended for long periods of time or expelled for conduct related or unrelated to their disability, can never be completely cut off from education services. Additionally, the judge said that getting an education is a fundamental right under the Arizona Constitution. The school district decided not to appeal and is negotiating a settlement.

LEARN MORE ABOUT P&As

P&As all over the country are working on a variety of cases with a common theme—ensuring that children in special education are receiving the services to which they are entitled under IDEA. The P&A System provides a unique and effective resource for disability rights advocacy and education. People with disabilities, their family members and representatives are encouraged to make use of these services. Consistent with available resources and priorities established by the community, the P&A will make every effort to provide appropriate assistance to remedy the situation.

For additional information about the P&A System, including the location of all P&As nationwide, contact the National Association of Protection and Advocacy Systems, at (202) 408-9514 (voice) or 202-408-9521 (TTY), or visit the P&A Web page, at http://www.protectionandadvocacy.com. For information about an individual case or local resources,see the directory of state listings below and on the following page.

A World-Class Weekend

Join forces and voices with people with disabilities

The first international forum of "information that matters from people who care" for people who care: families and professionals in science, medicine, education and advocacy.

November 10-12, 2000, Atlanta, Georgia

Exceptional Parent Magazine and H.A. Bruno, LLC invite people with disabilities, their families, and professionals from the fields of healthcare and education from across the United States, Canada and around the world to share information, strategies, experiences, ideas, and innovations.

For Exhibitor and Attendee Info.: Call 877-923-3976 (877-WCD-EXPO) Outside the U.S.: 201-226-1446
Visit our Web site at www.wcdexpo.com

A proven successful alternative to total community inclusion and institutionalization... Annandale Village

✦ OUR MISSION ✦

Annandale's mission is to perpetuate a private, nonprofit Village community offering adults with developmental disabilities an improved quality of life. The Village provides professionally managed and cost effective lifestyle alternatives through specialized programs and services flexible enough to meet individual needs . . .

Their Community With Our Help.

✦ THE ANNANDALE STORY ✦

Annandale Village provides a natural and serene environment for adults with developmental disabilities. Annandale began through the concern of Dr. and Mrs. Maxwell Berry for the future and welfare of their child with developmental disabilities. They wanted what all parents want for their children in adulthood. . . the opportunity for the best life possible. But for the Berry's child and others with similar disabilities, future options and opportunities were very limited.

Dr. and Mrs Berry traveled extensively in the United States and abroad, studying facilities for adults with special needs. They believed that the European concept of a village community could be successfully adapted to create a desirable and beneficial alternative to institutionalization and community inclusion.

Incorporated in 1969 as a 501C(3), Annandale Village is now located on 136 acres in Suwanee, Georgia, just 30 minutes north of Atlanta. The village setting is one of natural beauty and peace among rolling hills, woodlands, pastures, orchards, vineyards, a farm, and a lake.

✦ THE SHELTERED WORKSHOP ✦

The Sheltered Workshop is a vital part of Annandale's paid vocational training program as well as an integral aspect of the Annandale concept. Workshop employment provides a source of income for many Villagers and serves as preparation for job placement outside the Annandale community. The sheltered workshop operates on a contract basis with local businesses, can perform a wide variety of jobs, and has a history of excellent quality control. References are available upon request.

✦ OUR PROGRAMS ✦

- *Paid Vocational Training and Job Placement*
- *Creative and Performing Arts*
- *Recreation/Leisure activities with skills training for Special Olympics*
- *Daily Living / Life Skills*

NNETT COUNTY
ECIAL OLYMPICS

Circle #99

2 in 3,000

kids

are born with spina bifida. But what do you do when they're both in

family?

At Easter Seals, we help families when children are born with disabilities. When their daughter Bethany was born with the same disability as their son Colin, the DeVaults called on Easter Seals. Today, Colin swims like a fish and Bethany rides her bike. One in every five Americans has a disability, and Easter Seals is there with expert help, hope and humanity. To learn more, call Easter Seals or visit www.easter-seals.org

Easter Seals

Creating solutions, changing lives.

At The New England Center for Children

each child's independence

is at the center of our attention.

There are many reasons why children come here, from all across the country, to The New England Center for Children.

They come for our nationally recognized educational, residential and treatment programs — all community based, all offered from one source. As a center of excellence, our efforts focus not on expanding into multiple locations, but on perfecting programs that will expand children's lives.

They come for our professional staff. Many are nationally known in the fields of autism and applied behavior analysis; all bring a special warmth and enthusiasm to everything from our preschool to our adolescent programs. Bringing to every child — your child — unwavering commitment. Each and every day.

They come and participate in services that range from intensive speech and language programs, to adaptive physical education, to employment training, to management of behavior problems.

And when, in time, each child leaves, individual potential has been reached, a new level of independence achieved.

Independence achieved through educational excellence.

At NECC, we welcome children diagnosed with autism, behavior disorders, learning disabilities, language delays, mental retardation and related disabilities. Nationally recognized for the success of our programs, we are equally well known for our dedication — on every level — to bringing about positive change in the lives of the children who come here. Change that helps them live more productively and independently, long after they leave.

The New England Center FOR CHILDREN

Independence through Educational Excellence

Exceptional children deserve exceptional care.

The best help for cerebral palsy, spina bifida and related disorders is at Kennedy Krieger Institute.

For 61 years, Kennedy Krieger Institute has been the leader in helping children with severe disabilities. Focusing on early identification, intervention and treatment, our state-of-the-art interdisciplinary team approach—combined with a caring, supportive touch—has enabled generations of children to live their lives to the fullest.

Our comprehensive assessment and treatment for children with cerebral palsy, spina bifida and related disorders includes: Neurology, Medical Services, Nursing, Urology, Orthopedics, Physical Therapy, Occupational Therapy, Orthotist, Clinical Psychology, Neuro-Psychology, Seating, Feeding, as well as Rhizotomy, Spasticity and Movement Disorder clinics.

And unlike many programs, we see patients beyond age 18. Call Kennedy Krieger Institute today. We're here to help.

...a new baby...the miracle...the joy...
the feel...the little fat legs...
the small gentle hand that touches your cheek...
the warm breath on your neck...
the unconditional love...
of a newborn with Down syndrome...

the sweet fold at the top of the ear,
the almond shaped eyes,
the simian crease,
the flat spot on back of the head,
the incision from heart surgery,
the precious gap between the toes,
the gentle inward curve of the tiniest finger

the special qualities of your child with Down syndrome comes to them especially from Downi Creations...

Chris Burke (Corky from the TV show Life Goes On) says, "I'd love to pick them 'Up' and never put them 'Down'."

Give your child the gift of love.

Now Your Child Can Wake Up Dry Every Morning!

With Tranquility disposable briefs, mornings can be easier for both you and your child, because Tranquility absorbs more urine without damaging tender skin. Rated number one by medical professionals, Tranquility is simply the best brief for your special child.

Tranquility's superior capacity means fewer changes and better skin all day long, too!

- Eliminates urine odor
- Latex-free
- Higher capacity
- Better skin protection

Free Samples

See the complete line of Tranquility products and order free samples at our website: www.gopeach.com, or call us, Principle Business Enterprises, for your free samples at 1(800)467-3224.

Try Tranquility incontinence products, and make every morning a good morning for you and your child.

The Whole World in Her Hands

Stephanie was born with more obstacles to overcome than most people. Early in life, she was diagnosed with bilateral club foot, scoliosis, spina bifida, hydrocephalus, severe hearing loss, mental retardation, and seizure disorder. For her, these conditions were not obstacles, but challenges. She set herself a goal: to live as independently as possible. But she would need help.

At the age of 15 she came to Heartspring School. Her multidisciplinary team helped her identify specific objectives within her larger plan, then develop the skills to accomplish them. In the home setting she learned to prepare meals, wash her clothes and iron them, groom and dress herself … handle her own daily medical care. At school and out in the community she honed her communication skills, polished her ability to read body language and situational context. She learned how to shop for groceries with the help of picture cards. She took a job in a local restaurant, practiced a solid work ethic, and enjoyed the rewards of earning a living.

This past summer, when Stephanie graduated from Heartspring School at the age of 21, her certificate of completion meant far more than an ordinary diploma. It meant living more independently, caring for herself, holding a job … participating in the community and the world.

If you know a child who could use some help with the challenges of living independently, call Heartspring School.

The New

Updown Chair

R.E.A.L. Design introduces a new kind of seating system, the Updown Chair, for children from 40" to 63" tall. Transfer and appropriate seat height adjustment are now made easy with our patented foot lever activation. Other features include tilt in space seat, pelvic stabilization adjustment, height adjustable tray, head and lateral trunk supports. A contemporary chair, with colorful, upholstered fabric and sturdy tubular steel frame, the Updown Chair will enhance any home or therapy center.

Children's Specialized Hospital
Where families turn for the answers to some tough questions about children.

Knowing where to turn for help is critical.

Diagnosing and treating children and providing information, training and support for their parents is not an adjunct to our work at Children's. It is the life's work of every one of the unique professionals on our staff.

We want to hear your questions.

How Important Is Mobility for Your Child? ....Apr 40

Personalized Interdisciplinary Programs

HMS School for Children with Cerebral Palsy serves children with multiple disabilities resulting from cerebral palsy or traumatic brain injury who need comprehensive, individually structured programs that include:

Physical & Occupational Therapies
Special Education
Speech/Language Therapy
Music Therapy
Communication Aids
Special Medical Attention
Adapted Recreational Activities

Computer Technology
Communication Devices
Environmental Control
Powered Mobility

HMS, founded in 1882, is open to students two to 21 years. The experienced staff and well-respected consultants provide strong interdisciplinary programs for day and residential students at the licensed private school.

For more information write or call:

Help is just a phone call away...

Are you looking for appropriate services for yourself, a loved one or a client with developmental disabilities?
Do you need information on religious services and materials?

Bethesda's National Christian Resource Center can help!
The NCRC offers:

- Lists of support services in specified geographic areas
- Referrals to advocacy and support groups
- Information on and referrals to special religious education programs
- Religious materials and other resources

A provider of quality Christ-centered care, Bethesda also offers workshops and resources to help initiate and enhance parish ministries to include people with developmental disabilities.

Positive Lifestyles

for people with developmental disabilities

Lifestyles mean opportunities for growth.

Lifestyles mean living with friends and people who care about you.

Lifestyles mean being a valued member of the community, an active participant in community activities, and using its resources freely.

Martha Lloyd Community Services is all about *Lifestyles* and community. For more than 70 years, it has provided the highest quality residential and vocational services. The rural village of Troy, in northeastern Pennsylvania, offers a variety of shops, restaurants, and churches all within easy walking distance. The feeling of being valued community members is affirmed as residents join local bowling leagues, participate in community activities, do their shop-ping in local stores, and meet friends at the village pizza shop. Our programs are uniquely designed to accommodate individual needs from supported living to highly structured situations and include a program for mature women.

- Life skills training
- Vocational training and employment opportunities at Martha Lloyd and in the Troy community
- Caring professional staff experienced in working with developmental disabilities
- Our interdisciplinary team approach assures continuity and consistency in individual planning
- Low staff turnover
- Unique leisure and recreational experiences in a rural community setting
- Excellent health care provided by on-site health professionals and a community health center
- Annual fees are among the lowest in the nation

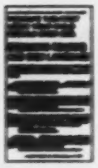
HEARING IMPAIRED

Sign Songs
Fun Songs to Sign and Sing
National Theatre of the Deaf
A video that is designed for both children and parents alike, offering a fun way to learn to sign and communicate with those who are hearing impaired.
Video 29 minutes/Color
[illegible] $19.98

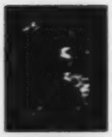
Deaf and Disabled Or Deafness Disabled?
Marian Corker
Using a multidisciplinary, postmodernist approach in the search for an inclusive framework for understanding deafness and disability the text exposes the essentialism inherent in existing social, political and service frameworks which confuses issues of needs and rights and contribute to the creation and reinforcement of the power imbalances at the heart of disability oppression.
[illegible] $25.95

The Words They Need
Welcoming Children Who Are Deaf And Hard Of Hearing To Literacy
Jessica Stelling
An in depth examination of the relationship between acquisition of vocabulary, grammar and reading within the needs of the child who has hearing impairments.
[illegible] $29.50



Beginning Reading and Sign Language
A video for those who wish to have their children learn sign. It is user friendly to both the hearing impaired and those who wish to learn sign as a form of communication with those who are hearing impaired.
[illegible] $19.99

I'm Deaf and It's Okay
L. Aseltine, E. Mueller & N. Tait,
Pictures by H. Cogancherry
How this little boy copes with the frustrations of deafness at play and at home.
[illegible] $14.95



Dina the Deaf Dinosaur
Carole Addabbo/Illustrated By Valentine
Not only a terrific guide to the language of Sign, it is a very effective example of how important communication is.
[illegible] $19.95

Chris Gets Ear Tubes
Betty Pace Illustrated by Kathryn Hutton
An explanation of what happens before, during, and after the surgery in language a child can understand. It takes away the child's natural fear of the unknown
[illegible] $9.95

Moses Goes To A Concert
Isaac Millman
A story about a hearing impaired going to a concert for the first time and his experiences at this special event. The book is written in sign and english.
[illegible] $16.00

Sign and ABC's
A New Way To Play
National Theatre of the Deaf
A fun video that teaches adults and children how to sign the alphabet, and offers an introduction to spelling.
Color/ 50 minutes
[illegible] Video $14.98

The Silent Garden
Raising your Deaf Child
Second Edition
Paul W. Ogden
An up to date reference comprising all the bits and pieces of advice, encouragement and hard data that parents might need in order to make decisions that will enable their children to grow into strong, healthy and productive members of society.
[illegible] $25.95

Legal Rights
The Guide For Deaf And Hard Of Hearing People
National Center For Law And Deafness
This fourth edition contains complete information on the Americans with Disabilities Act, the Television Decoder Circuitry Act, and full updates on all other laws and legislation that affect deaf and hard of hearing people. Excellent guide for compliance.
[illegible] $19.95

A Button in Her Ear
Ada B. Litchfield
Pictures: Eleanor Mill
Approximately 7% of school children have some degree of hearing loss. Story reinforces a child's healthy attitude toward use of a hearing aid. For children in similar circumstances this story has special meaning and sets the stage for new understanding.
[illegible] $14.95

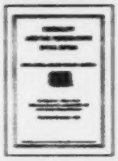
Helen Keller Public Speaker
Sightless But Seen, Deaf But Heard
Lois J. Einhorn
Helen Keller was an uplifting orator who spoke from a unique vantage point for the cause of social improvement. This is a collection and analysis of some of her finest speeches and presentations.
[illegible] $55.00

My Signing Book of Numbers
Patricia Bellan Gillen
This full-color picture book helps children learn their numbers in sign language. Each two-page spread has the appropriate number of things or creatures for the numbers 0 to 20. Signs for 30, 40, etc. to 100 and instructions on "how to" are included.
[illegible] $14.95

SPINA BIFIDA

Answering Your Questions About Spina Bifida
A Guide from the Spina Bifida Program Department of General Pediatrics
Edited by C. Shaer
Contains information to help understand basic medical, educational, and social issues of children and adults with spina bifida.
[illegible]-english $6.95
[illegible]-spanish $6.95
Available in Spanish

Medical Facts About Spina Bifida
C.T. Dipoli, M.D. & S.L. Kinsman, M.D.
Information to answer your basic questions about spina bifida.
[illegible] $4.00



Sexuality And The Person With Spina Bifida
Spina Bifida Association of America
It is important to understand the impact that spina bifida has on sexuality. It is more important that the potential for healthy expression that does exist for persons with spina bifida be understood and education be made available for them and their families.
[illegible] $9.95

VISUALLY IMPAIRED

Can't Your Child See?
A Guide for Parents of Visually Impaired Children
E. Scott, H. Jan & R. Freeman
Practical guidelines for helping visually impaired children reach their full potential.
[illegible] $28.00

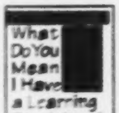
Children with Visual Impairments
A Parents' Guide
Edited: M. Cay Holbrook, Ph.D.
Designed to help parents get a handle on common types of concerns. Written by a team of professionals and parents, each of whom is an expert on a different aspect of caring for children with visual impairments.
[illegible] $26.95

LEARNING DISABILITIES

Planning For Success
The College Application Process for Students With Learning Disabilities
The college admission process can be a confusing and overwhelming experience for students with learning disabilities and their families. This comprehensive video enables you to see the college application process from the very beginning. It shows early planning, college visits, the essays, and how to choose the best school for you.
[illegible] $49.99

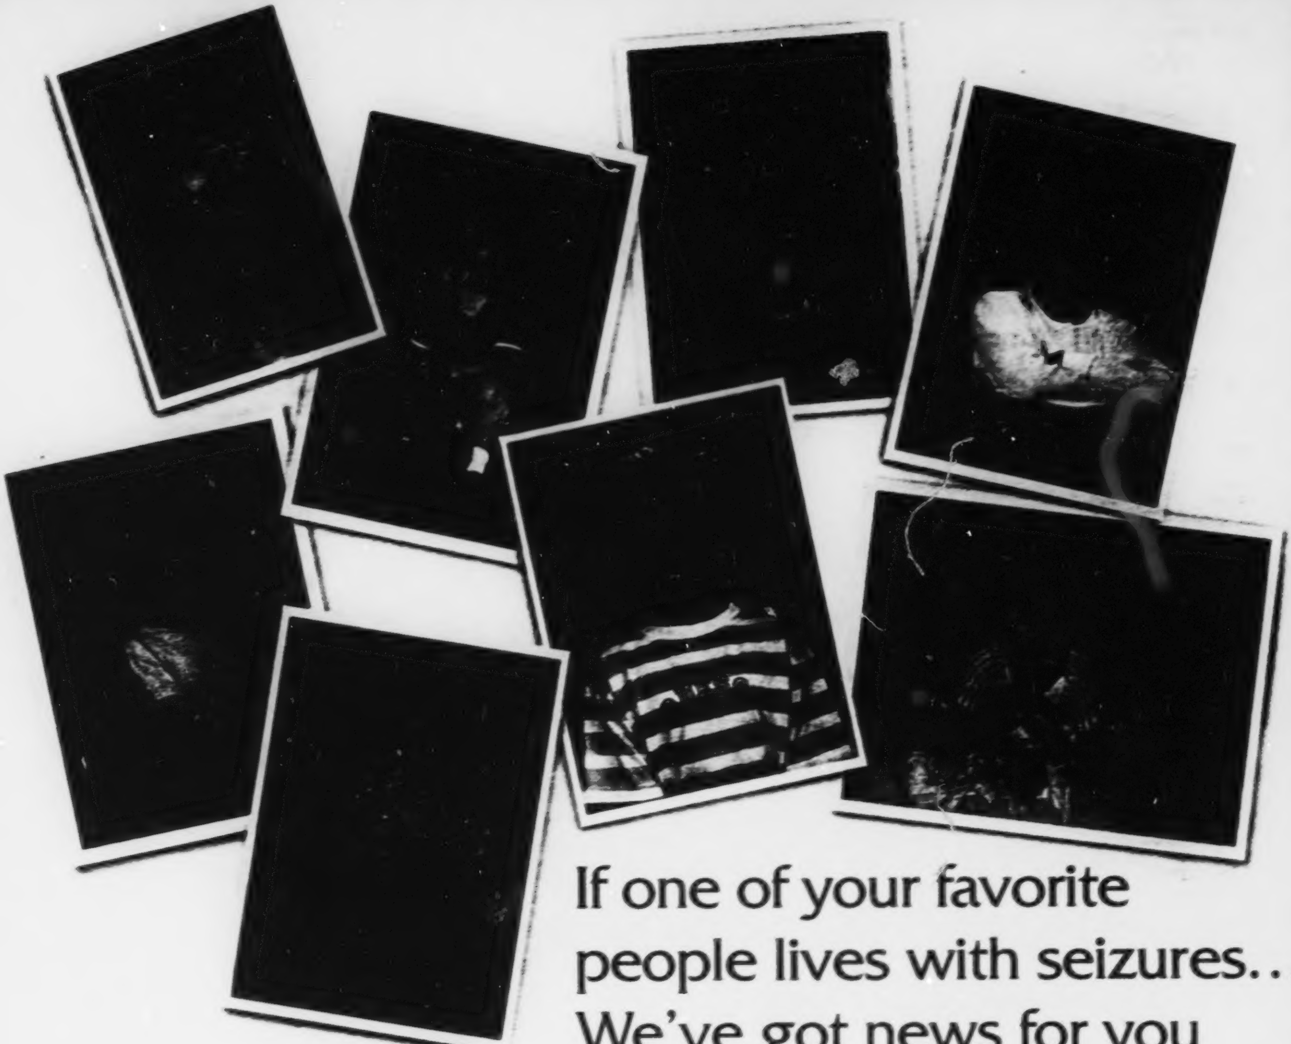
Special Talents, Special Needs
Drama for People With Learning Disabilities
Ian McCurrach and Barbara Darnley
A handbook for teachers and facilitators working with learning disabled people who are interested in creative expression through drama. A step-by-step guide beginning with finding an appropriate setting and assessing the group and progressing through five parts and thirty different sessions to conclude with the planning of a showing or performance.
[illegible] $29.95

I Wish I Could Fly Like A Bird
Audio Tape and Book
Katherine Denison
Children who have been taunted for being different, who have ever felt embarrassed socially, who have resorted to bravado in the face to shame will understand Chic L Dee, a boy bird who discovers his talents; trusts his intuition; and finds his own way.
Exceptional Parent reviewed the book in the 3/98 issue.
[illegible] $17.95



What Do You Mean I Have A Learning Disability?
Kathleen M. Dwyer
Photographs by Barbara Beirne
For children who are learning disabled and their families and friends, this inspiring book offers encouragement and support in a shared effort. The story of a ten year old who was not diagnosed until a teacher discovered the problem.
[illegible] $14.95

The Experts Speak
Parenting the Child With Learning Disabilities
Teresa A. Citro
A clear, comprehensive, and direct collection of writings by professionals in the field of learning disabilities in their area of concentration. Whether it is teaching, parenting, or socialization there are stories on it here.
[illegible] $18.99



If one of your favorite people lives with seizures…

Cindy can give you many reasons why people who are deaf-blind, like herself, should be given a chance to work.

But not right now.

She's busy filling a customer's order.

1-800 FLOWERS is proud to employ Cindy Gagnon. She is one of hundreds of skilled deaf-blind people employed at corporations such as the Gap, Hewlett Packard, Avis, and Pizza Hut as assemblers, computer/data entry personnel, and food service workers.

If you have job openings and would consider hiring a person who is deaf-blind, please call the Helen Keller National Center and speak with the vocational coordinator at 1-800-255-0411 ext. 300.

We're Looking for You!

Exceptional Information for Exceptional Families

We are bigger and better than ever.

As a first-time subscriber you can **SAVE 48% OFF** the newsstand price by taking a **$36** paid subscription. And it includes the **FREE Annual Resource Guide**, with comprehensive directories of organizations, associations, products and services. It is the single largest and most widely-referred to directory in the entire disability field, and normally sells for $19.95.

EXCEPTIONAL PARENT was created in 1971 by three clinical psychologists, specialists in the care and education of children with disabilities and their families. EXCEPTIONAL PARENT's editorial mission was, and still is, to provide practical information, guidance and emotional support for parents and professionals in one forum.

For more than 25 years, this award winning magazine has brought its readers the latest information and innovations in the fields of health care and disability. Our readers, old friends and loyal subscribers, agree that we produce a truly wonderful publication.

Information that matters, from people who care.

If a family member has special needs, you need EXCEPTIONAL PARENT.
Subscribe today, and ***help us help you.***

2000 Editorial Calendar

Technology, mobility, healthcare, sports and recreation, learning disabilities, early intervention, organizations, and **finance** are the **core topics** covered extensively and often in EXCEPTIONAL PARENT Magazine. Each issue will also include a special section, a cluster of in-depth features on a single topic.

Here are the themes you can look forward to seeing in 2000:

FEBRUARY	**Early Childhood**
MARCH	**Medical Research Update**
APRIL	**11th Annual Mobility Issue**
MAY	**Recreation, Sports and Play**
JUNE	**Technology in Education & Daily Living**
JULY	**Adolescence and Transitioning**
AUGUST	**Healthcare**
SEPTEMBER	**Annual Education Issue**
OCTOBER	**Toy and Holiday Activities**
NOVEMBER	**Technology**
DECEMBER	**Family, Friends & The Community**

Regular columns include Ask the Doctor, Search and Respond, Organizational Spotlight, Role Models, EXCEPTIONAL PARENT Web site, and the Children's Page.

PediaSure® Families. Lisa and David Bickel and their daughter, Shayna, who has cerebral palsy, live in Scottsdale, Arizona.

PediaSure helps Shayna get the nutrition she needs.

All kids need proper nutrition for growth and development. So if your child is not getting enough of the right nutrition from regular food, ask your doctor about PediaSure®. Specially formulated for children, PediaSure is complete liquid nutrition that provides balanced amounts of protein, fat, carbohydrate, vitamins and minerals. Look for PediaSure in your local supermarket or pharmacy.

Circle #32

Just because you don't see carnitine deficiency doesn't mean it's not there.

Carnitine plays a vital role in energy production. Typically, 75% of a patient's carnitine needs are met through dietary intake. And healthy patients depend on proper liver and kidney function to maintain adequate carnitine status. Carnitine functions by binding with fatty acids so they can be transported into the mitochondria for energy production and also binds with metabolic waste products so they can be transported out of the body.

Carnitine deficiency is hard to detect and often overlooked. Patients who exhibit findings consistent with carnitine deficiency should be evaluated for treatment with Carnitor®

Clinical findings associated with carnitine deficiency may be as subtle as any of the following:

- cardiomyopathy
- muscle weakness
- lethargy
- poor muscle tone
- seizures
- low levels of activity
- developmental delay
- slow growth

Carnitor
levocarnitine

Injection 1g/5mL & 500mg/2.5mL
For intravenous use only.

Carnitor® is the only treatment for carnitine deficiency.

For Carnitor® Medicare reimbursement assistance, call 1-800-490-3262.

For any other questions, call 1-800-447-0169.

Adverse events reported with Carnitor® use include nausea, vomiting, body odor, gastritis, and seizures. There are no reported contraindications or warnings. Please refer to the attached brief summary of prescribing information.

For intravenous use only.

Circle #55

Carnitor®
levocarnitine

Injection 1g/5mL & 500mg/2.5mL
For intravenous use only.

Clinical Findings Associated with Carnitine Deficiency:

- cardiomyopathy
- muscle weakness
- lethargy
- poor muscle tone
- seizures
- low levels of activity
- developmental delay
- slow growth

Conditions Associated with Increased Risk for Developing Carnitine Deficiency:

- fatty acid oxidation defects
- mitochondrial myopathy
- dialysis
- premature birth
- administration of carnitine- free TPN
- treatment for HIV—especially administration of zidovudine (AZT)
- administration of valproic acid
- administration of pivalate derivatives
- administration of emetine
- administration of sodium benzoate

Adverse events reported with Carnitor® use include nausea, vomiting, body odor, gastritis, and seizures. There are no reported contraindications or warnings. Please refer to the adjacent brief summary of prescribing information.
For intravenous use only.

CARNITOR® (Levocarnitine) Injection 1 g per 5 mL and 500 mg per 2.5 mL. FOR INTRAVENOUS USE ONLY. Brief Summary of Prescribing Information. (Please see package insert for full prescribing information.) **Description:** Levocarnitine is a carrier molecule in the transport of long chain fatty acids across the inner mitochondrial membrane. CARNITOR® (Levocarnitine) Injection is a sterile aqueous solution containing 1 g of levocarnitine per 5 mL ampoule and 500 mg of levocarnitine per 2.5 mL ampoule. The pH is adjusted to 6.0 - 6.5 with hydrochloric acid. Chemically, levocarnitine is (R)-3-carboxy-2-hydroxy-N,N,N-trimethyl-I-propanaminium hydroxide, inner salt. It is a white powder with a melting point of 196-197–C and is readily soluble in water, hot alcohol, and insoluble in acetone. The pH of a solution (1 in 20) is between 6-8 and its pKa value is 3.8. Its chemical structure is: **Empirical formula:** $C_7H_{15}NO_3$ **Molecular weight:** 161.20. **Clinical pharmacology:** CARNITOR® (Levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters. Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® (Levocarnitine) may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted. Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, less than 20 µmol/L at one week post term and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels. **Indications and usage:** For the acute and chronic treatment of patients with an inborn error of metabolism that results in secondary carnitine deficiency. **Contraindications:** None known. **Warnings:** None. **Precautions:** Carcinogenesis, mutagenesis, impairment of fertility - Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that levocarnitine is not mutagenic. No long-term animal studies have been performed to evaluate the carcinogenic potential of levocarnitine. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance. **Pregnancy:** Pregnancy Category B - Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR® (Levocarnitine). There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed. **Nursing mothers:** It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother. **Pediatric use:** See Dosage and administration. **Adverse reactions:** Transient nausea and vomiting have been observed. Less frequent adverse reactions are body odor, nausea, and gastritis. An incidence for these reactions is difficult to estimate due to the confounding effects of the underlying pathology. Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported. **Overdosage:** There have been no reports of toxicity from levocarnitine overdosage. The oral LD50 of levocarnitine in mice is 19.2 g/kg. Large doses of levocarnitine may cause diarrhea. **Dosage and administration:** CARNITOR® (Levocarnitine) Injection is administered intravenously. The recommended dose is 50 mg/kg given as a slow 2-3 minute bolus injection or by infusion. Often a loading dose is given in patients with severe metabolic crisis followed by an equivalent dose over the following 24 hours. It should be administered q3h or q4h, and never less than q6h either by infusion or by intravenous injection. All subsequent daily doses are recommended to be in the range of 50 mg/kg or as therapy may require. The highest dose administered has been 300 mg/kg. It is recommended that a plasma carnitine level be obtained prior to beginning this parenteral therapy. Weekly and monthly monitoring is recommended as well. This monitoring should include blood chemistries, vital signs, plasma carnitine concentrations (the plasma free carnitine level should be between 35 and 60 micromoles/liter) and overall clinical condition. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit. **Compatibility and stability:** CARNITOR® (Levocarnitine) Injection is compatible and stable when mixed in parenteral solutions of Sodium Chloride 0.9% or Lactated Ringer's in concentrations ranging from 250 mg/500 mL (0.5 mg/mL) to 4200 mg/500 mL (8.0 mg/mL) and stored at room temperature (25° C) for up to 24 hours in PVC plastic bags. **How supplied:** CARNITOR® (Levocarnitine) Injection, 200 mg per 1 mL, is available in 5 mL single dose ampoules packaged 5 ampoules per carton (NDC 54482-146-09) and in 2.5 mL single dose ampoules packaged 5 ampoules per carton (NDC 54482-146-10). Made in Italy. Store ampoules at controlled room temperature (25° C). See USP. Store in carton until their use to protect from light. Discard unused portion of an opened ampoule, as they contain no preservative. CARNITOR® (Levocarnitine) is also available in the following dosage forms for oral administration: CARNITOR® (Levocarnitine) Tablets are supplied as 330 mg tablets embossed with "CARNITOR ST" in individual blisters, packaged in boxes of 90 (NDC 54482-144-07). Made in Italy. CARNITOR® (Levocarnitine) Oral Solution, is supplied in 118 mL (4 FL. OZ.) multiple-unit plastic containers. The multiple-unit containers are packaged 24 per case (NDC 54482-145-08). CARNITOR® (Levocarnitine) Oral Solution is manufactured for Sigma-Tau Pharmaceuticals, Inc. By: Alpharma USPD, Inc. Baltimore, MD 21244-2654 and/or for Hi-Tech Pharmacal Co., Inc. Amityville, NY 11701. **Rx only.**

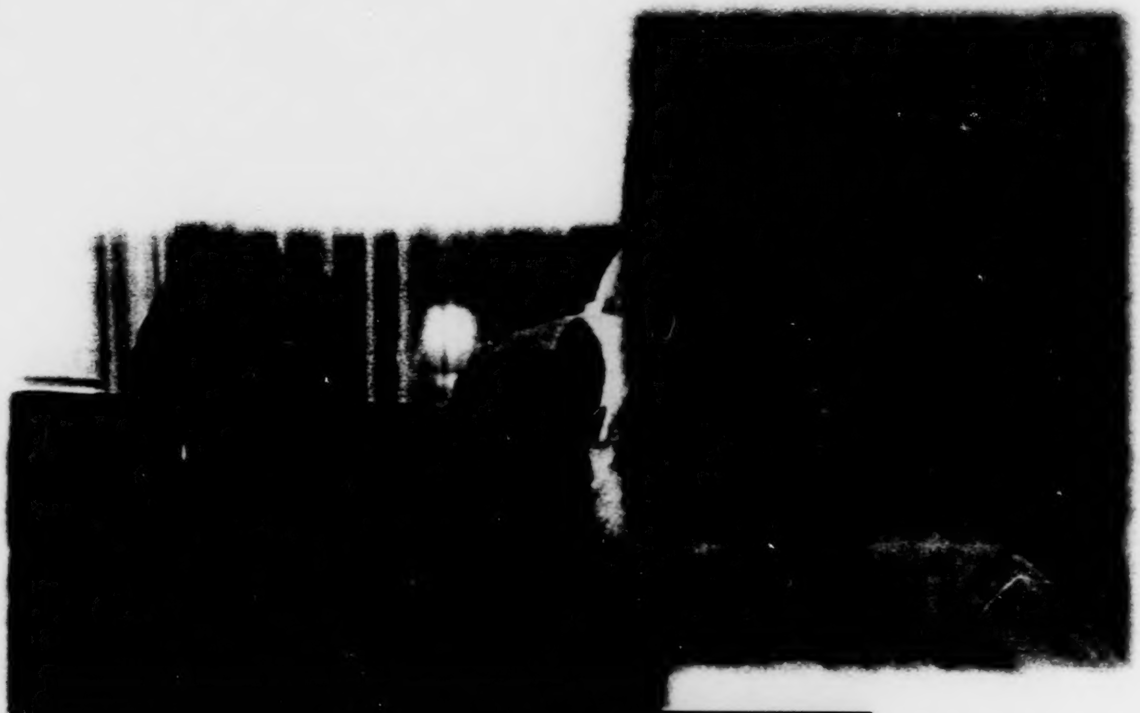
Do you have: Cerebral Palsy • Multiple Sclerosis • Brain Injury • Spinal Cord Injury



Simple Pleasures.

Severe spasticity may keep you and your family from life's simple pleasures. It doesn't have to. Now there are new ways to help control even the most severe spasticity in adults and children with these conditions: cerebral palsy, multiple sclerosis, brain injury, or spinal cord injury.

Talk to your doctor about new options in spasticity control, or call 1-800-664-5111, ext. 240.

EDITOR'S DESK

Time for Taking Stock

February marks the mid-point in the school year, making it a perfect time to review your child's school progress. Check in with your child's educators to make sure they are following the school plan that you approved. If any changes have been made or need to be made, now is the time to discuss them. Although we are in the depths of winter, now is also the time to make plans for the next school year, as well as for the summer.

In "Darwin Goes to Camp," Darwin Carter's mother, Susanne, describes the emotions that are aroused when sending a child with a disability "away" for the first time. The positive contribution this experience made to his growth and development, as well as hers, belied all her initial fears. Next month we will include reader feedback on summer programs.

Susan Senator shares "The Secret to Happy Vacations" in her article by describing the planning that was necessary for her family's getaway. Many of the tips and suggestions that have worked for her family, which includes her son who is on the autistic spectrum, may be useful to other parents taking their clan "on the road."

You don't have to leave home to find fun and enjoyment in some everyday activities. "Bathtub Play" by the Let's Play! Project, describes some creative ideas to make bath time an opportunity for building skills while having fun. Let's Play! is a project of the Center for Assistive Technology at the State University of New York at Buffalo. The group, led by Susan Mistrett, has hands-on experience in adapting environments to encourage play for children with special needs, ages birth to 2. Though the group's focus is on early childhood, the play ideas that they have come up with can take the hassle out of bathing for any parent and child.

Early childhood—and beyond

The key element in any child's life is his or her family. We have always believed that the families of children with disabilities are real pioneers—having to find pathways for growth with few markers along the way and, sometimes, with little support. We often underestimate the energy and stamina this requires, and how much pressure these parents experience.

Recently, the Kelso family of Pennsylvania made national headlines when they left their son, who has cerebral palsy, at a hospital for children with disabilities, along with a note saying that they were no longer capable of caring for him. Naturally, there was shock at their abandoning their child in this way, and the opinion towards this family grew increasingly negative as it was revealed that the parents were financially secure. They should have been able to afford any services that were necessary.

Although no one should abandon a child in this fashion—or any other—the story unfolded, revealing problems that are well known to families who have children with disabilities. The Kelsos had been dedicated to the care of their child from birth. They were also leading advocates and leaders in their community. But what happened? No one can know what determines the actions of other people, but it is clear that money is not the real issue in the unending work and dedication of parents.

In December, Esther Schleifer had the privilege of interviewing the Crowley family of Pennington, N.J. Parents John and Aileen care for three young children, two of whom have been diagnosed with Pompe's disease, a potentially fatal illness. With great determination, faith, and optimism the family faces this challenge and we are proud to add them to the EXCEPTIONAL PARENT Hall of Fame. In Part One of this interview, the couple describe the source of their great optimism, which sustains everyone, including the various caretakers of their children; how they take care of the needs of their "well" child; the management of the treatment team; and the need for respite.

Special Report

Augmentative communication devices are making a significant difference in the lives of children. To expand on some of the points addressed in last year's special report on "Choosing and Using Augmentative Communication" (October, November and December 1999), we present the first of a series on "Can We Talk?: Parents' Perspectives on Augmentative and Alternative Communication." The article prepares parents for the assessment process and the roles and functions of the various professionals who evaluate a child.

Mark your calendars

EXCEPTIONAL PARENT is co-sponsor of the World Congress & Exposition on Disabilities (WCD), which will take place on November 10-12, 2000, in Atlanta, Georgia. Among the other sponsors of this informative event are United Cerebral Palsy, the Epilepsy Foundation, The Arc, Family Voices, the National Perinatal Association, and the National Down Syndrome Congress. We invite individuals with disabilities and their families, along with leading international experts in disability-related fields, to join us in this exchange of knowledge and experience. For more information, contact the WCD at: (877) 923-3976 or (201) 226-1446; Web site: http://www.wcdexpo.com.

Maxwell J. Schleifer, PhD
Editor-in-Chief

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing, can, even in a small way, change a child's way of life.

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Pull-Ups
GoodNites
DISPOSABLE ABSORBENT UNDERPANTS
45 lb & over

For Better Days.

Imagine your child gaining a little more independence just by a change in clothing. For information on how GoodNites can help, and a free sample offer, please visit us at www.goodnites.com/offer

Evaluating school districts

My husband is considering a job in another state. I have a 2-year-old who has cerebral palsy. Our local school district has a very good reputation for its special education services. How can I evaluate whether the schools in our future home state have good special education services?

—L.T., from the EP Web site

Respite care

I am a mother of two children with severe disabilities, and because my husband and I make too much money, we cannot get any help with the care of our children. Do you know any organizations that could help us get respite or nursing help in the home? We live in Michigan.

—Marcy, from the EP Web site

Prematurity and hydrocephalus

I am a mother of an infant who was born 14 weeks premature. He had all the expected problems, but I thought that even with the illnesses and frequent hospital stays all would be well. He is now 2. He has right hemiparesis (a definite weakness in the muscles on the right side). He still does not speak at age level and has begun to have complex partial seizures from minor brain damage. He also has hydrocephalus. I am looking for anyone in the same situation to give me some encouragement and advice.

—jhnylawdg, from the EP Web site

RESPONSE: *I am the mother of a child born 16 weeks premature with lots of complications, including hydrocephalus (shunted). At two years my son was nonverbal and had to be put back on oxygen. It seemed what the NICU nurses called "the roller coaster" was quite true—we went up, then down. We worked very hard and kept my son involved in early-intervention programs. We also accessed speech therapy through our insurance. The effort has paid off. My son is now 5, and although there continue to be challenges, such as having the shunt replaced when it broke, he is very verbal and in September entered · inclusive kindergarten with some support services.*

—pjstabile, from the EP Web site

EDITOR'S NOTE: *To better serve our readers and to take advantage of the power of the World Wide Web, EP will publish more of these "instant" Responds in future issues from our Web site (http://www.eparent.com). We will also continue to accept Responds via fax or regular mail (see below for information).*

CindyLift

I need information on the CindyLift. Where can I check into getting one to try it so we can determine if it would work for our family or not?

—V.M., from the EP Web site

continued on page 10

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. We also expect parents to consult appropriate professionals.

Please indicate whether the letter is a Search or a Respond. If it is a Respond, be sure to note in which issue the original Search letter appeared. All responses are forwarded to the writers of the Search letters; some are published. Published letters may be edited for purposes of space and clarity. Please remember to include a phone number in the event that more information is required.

Write or fax: Search or Respond, *Exceptional Parent,* 555 Kinderkamack Rd., Oradell, NJ 07649-1517, (201) 634-6570 or visit Search and Respond on our Web Site: http://www.eparent.com. For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518 (http://www.NORD-RDB.com/~orphan). Also, see "National Resources for Specific Disabilities and Conditions" in *Exceptional Parent's* 1999 Resource Guide (January 1999).

The National Parent-to-Parent Support and Information Service (NPPSIS) is a not-for-profit service that keeps track of children with diagnosed and undiagnosed disabilities whose parents are looking for a match. Parents are matched with a "veteran parent," with an older child who has a similar condition and is willing to provide guidance and support. Contact: NPPSIS, P.O. Box 907, Blue Ridge, GA 30513; (800) 651-1151 (V/TTY) or (828) 494-5415; (828) 494-5414 (fax); E-mail: nppsis@elijay.com; Web site: http://www.nppsis.org.

EXCEPTIONAL PARENT

EDITORIAL MISSION

- *To reach out to mothers and fathers of children and young adults who have disabilities and special healthcare needs.*
- *To empower parents and professionals by providing practical information and emotional support.*
- *To appreciate that parents are the most important experts in the lives of their children.*
- *To energize parents and professionals.*
- *To share ideas and experiences so parents, professionals, people who have disabilities, and other advocates can learn from one another and better collaborate to serve all children and families.*

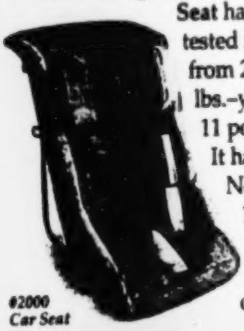
Johnny, 51 lbs. and 48" tall, in the Columbia Car Seat

Columbia offers you solutions to the daily challenges of transporting, bathing and toileting your child – *with comfort, safety and ease!*

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

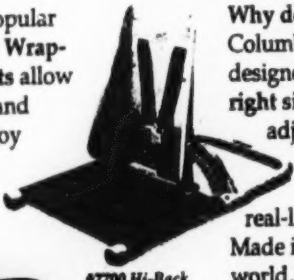
■ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! It has been the No. 1 choice since 1986, for its adjustability and stylish comfort.



#2000 Car Seat

■ At bathtime, our popular **Reclining Chairs** and **Wrap-Around Bath Supports** allow your child – and you – to enjoy the bath.

#6500 Medium Recliner for a child [illegible]-54" tall, up to 130 lbs.

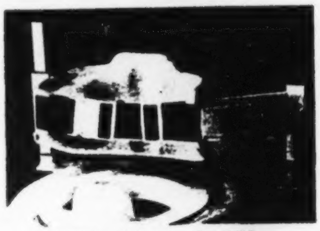


#7700 Hi-Back Wrap-Around Support

■ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

Why do these products work so well? Columbia products are thoughtfully designed, with each item available in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, tested and proven in real-life experience.

Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.



#4200 Small Support for children

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

FINALLY,
A Nutrition
Supplement For
Special Needs...

NuTriVene-D

Targeted Nutrition Intervention

Ask your physician about NuTriVene-D
Or call for more information or to order
1-800-899-3413

As Seen On
ABC News Nightline,
The 700 Club, and
48 Hours

Children and adults with Down syndrome and other genetic disorders have unique nutritional needs. Now there's a nutrition supplement formulated for those special needs.

NuTriVene nutritional supplements include vitamins, minerals, amino acids, antioxidants, and other essential nutrients. NuTriVene may also be customized for the nutritional needs of your child.

NuTriVene does not require a prescription, although we encourage you to talk to your physician about NuTriVene.

NuTriVene may be mixed with infant formulas, foods, and many drinks. And, it contains no artificial colorings or flavorings.

"As skeptical parents we were completely amazed at the changes that occurred in our son after he started NuTriVene. He is more alert, curious, and much healthier." L. Sotok - Holland, MI

EDITOR'S NOTE: *The CindyLift is a device which enables one caregiver to transfer/lift a person with a disability from one place to another for toileting, bathing, dressing, etc. The current list price for the CindyLift is about $1600 including shipping and handling. They do not provide a trial period, but will accept returns and issue refunds. For a brochure with pictures and operating instructions, contact Creative Disability Solutions, 1685 James Winston Road, Oxford, NC 27565; phone: (919) 693-2796; or E-mail: cwinston@gloryroad.net).*

Bruxism and mouthing in autism

My 3-year-old son has autism. We are currently working with his autism specialist on oral motor therapy because he is constantly mouthing and chewing on objects. He loves it when I brush his teeth and the roof of his mouth. I have also provided him with teething toys. I am looking for ideas to help him stop grinding his teeth (bruxism) all the time and interested in techniques other parents use to deal with this and the chewing.

—Gina, from the EP Web site

Night paralysis

My typically developing 2-year-old son has had six episodes of "night paralysis" in the last eighteen months. He wakes up with a weak cry and his entire body is limp. His eyes are open but unfocused, and he does not respond to touch or sound. These episodes last up to ten minutes, after which he is lethargic, weak, and has difficulty controlling his muscles for tasks like swallowing or holding a cup. After sleeping the rest of the night, he wakes up in the morning with no apparent effects.

—Tamara, from the EP Web site

Dr. Feudtner: Ask your doctor for a referral to a good pediatric neurologist.

SAFEGUARD YOUR CHILD'S FUTURE TODAY!

It's important that you take the time today to provide for your child's tomorrow.

At MetLife we know that parenting children with special needs takes exceptional planning. That's why we created **MetDESK** (Division of Estate Planning for Special Kids), staffed by a group of specialists who can help you navigate the many financial and legal issues involved in providing quality lifetime care for your child. Each member brings indepth knowledge and understanding of families with special needs children.

In fact, MetDESK recently received the *National Business & Disability Council's Valued Customer Gold Award of Honor* in recognition of MetLife's leadership in responding to the special needs of families of children with disabilities.

RESPOND

Mitochondrial metabolic disorder

B.B. (from the EP Web site: http://www.eparent.com) has a 2-year-old son with developmental delays and has been given a possible diagnosis of mitochondrial metabolic disorder (disorders that are characterized by decreased energy production by the cells of the body). B.B. would like to hear from anyone familiar with this.

I am a pediatric hematologist/oncologist by training and a parent of a son with Complex I and III deficiencies (deficiencies in chemicals that help cells produce the energy your body needs), which are mitochondria-based illnesses. Most practitioners feel that mitochondrial diseases are very rare. In fact, it is estimated that some type of mitochondrial disease affects nearly 1 in 4,000 births.

Some of the highlights of mitochondrial disease include the following:

1) First and foremost, people with identical defects in their metabolism will not have the same outcome.

2) There is currently no definitive cure, and the preliminary prognosis that doctors will give you is usually poor. (My son, however, was not supposed to live beyond 10 months. He celebrated his first birthday this past summer.)

3) Dealing with mitochondrial disease is like taking one of the world's biggest roller coaster rides.

4) I suggest that you check into the United Mitochondrial Disease Foundation (UMDF) for more information. They have a wonderful Web site with a lot of information (http://www.umdf.org/).

5) Despite how "rare" it is, keep in mind that you are not alone. Some researchers now believe that Parkinson's and Alzheimer's are mitochondria-based disorders.

6) There are only a few centers on the North American continent that deal with mitochondrial disease. The UMDF can help you find the one nearest you.

—Kenneth M. Hirsch, M.D., F.A.A.P., New Jersey; Web site: http://hirsch@rivendell-peds.com/special_needs.htm

EDITOR'S NOTE: *You can contact the UMDF at: P.O. Box 1151, Monroeville, PA 15146-1151; Voice: (412) 793-8077; Fax: (412) 793-6477; or E-mail: umdf@nb.net.*

In addition, Exceptional Parent published a three-part special report in 1997, which can be ordered by calling the EP Library at (800) 535-1910.

Infantile Spasms

T.L., Swanee, Georgia (October '99), has a 10-month-old daughter who has infantile spasms. She also has feeding problems, including gagging, vomiting, and a "pulling" motion that may or may not be a result of seizure activity. T.L. would like any input on the condition.

Our daughter (now age 20) had seizures that looked like gagging as a child. About 3 years ago she was diagnosed with esophageal reflux. I recommend that you consult with a gastrointestinal specialist as well as a pediatric neurologist.

—B.N., California

Portable Augmentative Communication Breakthrough

(built-in touchscreen and [optional] switch capabilities)

Powered by Microsoft Windows CE

$999 Casi-Comm

- Easy to program: use any pictures: (our packaged 10,000, your own scanned or digital images, Mayer-Johnson PCS, or any commercially available libraries).
- Setup hyperlinked screens on your desktop PC or Mac, then transfer to your Casi-Comm; end your frustration with trying to set up with too small a screen.

Tough as nails & Cute as a button

At Otto Bock Rehab® we are concerned as much with the way a product looks and feels, as we are how well it stands up to the demands of the user. The Panda TRS Plus® is a tilt and recline, dependent mobility system designed for children with moderate to involved needs. It features a tilt of 40°, and recline of up to 140°, providing a variety of positioning adjustments. The multifunctional seating unit can be easily removed, and has the ability to face either forward or toward the caregiver. The Panda TRS Plus has been engineered and built following the most strict standards, supported by a 5-year limited warranty. That means the Panda TRS Plus will not only look great, it will withstand years of use. Along with other products including the Busy Bee® walker, the Spee-Dee® gait trainer, and the Lisa® mobility system, Otto Bock Rehab is helping to make life a little easier, and alot more fun.

Nominee for Exceptional People Awards

Brookes Y. Gordon of Lakekand, FL nominated her parents, Michael and Andrea for the Exceptional People Awards which appeared in the January issue of EP. Brookes, 16, has a rare neuromuscular disease called Werding-Ho[illegible] syndrome (characterized by progressive muscular weakness and atrophy). Brooks credits her parents with giving her the tools to meet her goals and desires. Brooks says, "Without having supportive parents and God, none of my desires and goals would have ever happened. This strength and determination comes from my parents always telling me that no matter what my physical limitations are, I can still achieve whatever I put my mind to."

Adaptive Windows™ tutorial

A Windows tutorial is now available on the Internet. The tutorial, Opening Windows 95™ was designed for adaptive technology users who are blind or have low vision. The tutorial is now available through the Columbia Lighthouse on three cassettes, including a workbook diskette. A large print version is also available. The taped tutorial provides step-by-step training in: taking phone messages in Notepad; organizing and updating information on the computer; using the functions of a new application; entering text, retrieving files, moving information from one application to another; and using shortcuts to streamline a Windows system. For more information, contact the Columbia Lighthouse at (202) 462-2900 x 3004, or (202) 462-4784; or by e-mail at tutorialsclb.org.

Top corporations unite to tackle employment problems

More than 20 national companies have come together to form a new consortium called Able to Work, to help expand employment opportunities for people with disabilities. The mission of Able to Work is to address the 71 percent unemployment rate of people with disabilities. These leading corporations have agreed to lead an advocacy effort among other corporate peers. The members of the Able to Work consortium represent a wide range of industries, all of whom have previously recruited and hired individuals with disabilities. The goal of the consortium is to increase employment opportunities by providing mentoring and direction to businesses throughout the country. Their Web site, http://www.Abletowork.org, provides member companies with an on-line venue for posting job openings, as well as serving as a resume-posting service, where companies can review the resumes of qualified applicants. Job seekers who do not have access to the Internet can send their resumes to NBDC, 201 I.U. Willets Rd., Albertson, NY 11501.

National Registry of Rehabilitation Technology Suppliers has a new Web site

The National Registry of Rehabilitative Technology Suppliers (NRRTS) has a new Web site. The site, located at http://www.nrrts.org, can help anyone who wants to locate a qualified professional who is knowledgeable about rehabilitative technology, such as wheelchairs, scooters, walkers, and other assistive devices. Features of the Web site include a fully searchable database to find NRRTS members, its Code of Ethics and Standards of Practice, a list of benefits to working with an NRRTS member, and a "Newsroom" for press releases and other important industry and professional information. NRRTS is dedicated to ensuring the provision of high-quality technology and related services to people with disabilities. All members of NRRTS meet specific professional membership requirements.

FDA establishes new Web site

The U.S. Food and Drug Administration (FDA) has established a new Web site designed to help consumers who are buying prescription drugs and medical products online. The purpose of the site is to increase public awareness about health, economic, and legal risks of online sales of prescription drugs and medical products. The site is located at http://www.fda.gov under the "Buying Medical Products Online" banners. The Web site also contains an electronic complaint form for consumers who believe they have encountered the illegal sale of drugs and medical products online.

Medtronic and NORD announce new program for people with spasticity

Medtronic Inc., and the National Organization for Rare Disorders (NORD) have announced the start of the Medtronic ITB™ Therapy Patient Assistance Program to help cover costs for those who need intrathecal baclofen injections for spasticity. The program helps eligible individuals obtain the Lioresal® intrathecal baclofen injection that is used in Medtronic ITB Therapy. The new Medtronic ITB Therapy Patient Assistance Program expands access to this effective treatment. Under the terms of the program, individuals whose federal, state, and private health insurance resources do not reimburse the drug costs for the therapy can apply for benefits that will

www.lawyersincorporated.com

Dear Parents:

When my son was born with brain damage, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

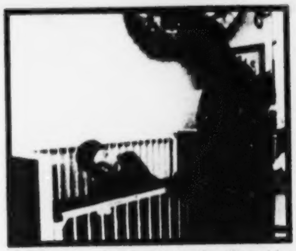
HARD MANUFACTURING

AGE APPROPRIATE
BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas



The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs, as well as locating your nearest HARD dealer, please give me a call.

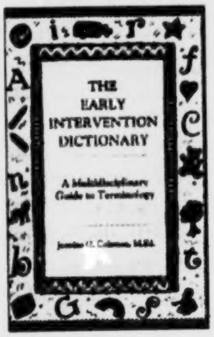
The Early Intervention Dictionary: A Multidisciplinary Guide To Terminology

By Jeanine G. Coleman, MEd

Published by: Woodbine House Publishing



THE EARLY INTERVENTION DICTIONARY
A Multidisciplinary Guide to Terminology
Jeanine G. Coleman, M.Ed.

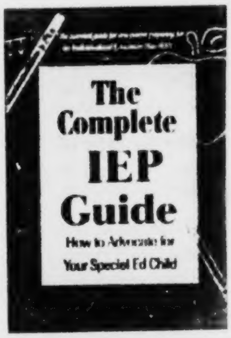
Becoming an active informed participant in your child's IEP is a process. Understanding the terms used by the professionals who care for your child is an important step in making sure the care is the best. That manual your child did not come with; well here it is. *The Early Intervention Dictionary*, by Jeanine G. Coleman, M.Ed.

Look up all those ABC terms come up regularly in your conferences with teachers, therapists, and doctors. From abductors, W-sitting, PDD, to growth charts it can all be found in this book, explained in family friendly terms. This is the book you will want with you at every meeting you attend. Become an equal player very fast with this great resource.

The Complete IEP Guide: How to Advocate for Your Special Ed Child

By Attorney Lawrence M. Siegel

Published by: Nolo.com Inc.



A source for information on individualized education plans(IEPs) you will not be able to proceed without is The Complete IEP Guide: How To Advocate for Your Special Ed Child, authored by attorney, Lawrence M. Siegel. This book guides you through the process of learning your rights, how to access the system, who has what roles and responsibilities, and where to obtain outside help. Last revised in June 1999, the information is very up-to-date. Chapters are broken down to go step by step, or to address your immediateconcerns. Start with identifying your child and his/her needs, requesting testing, how to obtain your child's records, and exploring available options. Sample forms and letters are supplied to guide you through the entire process. Step by step, you go through the process—from your options, to making your case. Learn how to write goal, objectives, and understanding measurable outcomes. As you gain knowledge and confidence in this process, you will no longer need to be one of those parents who arrives at meetings waiting to see what they will offer.

Instead, by the time your child's IEP meeting actually starts, everyone on your child's team will know what you want, why, how you hope it will be accomplished, and their role in the process. Should things not go well, this guide goes through the dispute process, Due Process, and filling complaints. There are resource lists with laws,what the IDEA (Individuals with Disabilities Act) says, recommended reading lists,and outside sources of guidance to offer additional help. This is one resource book you will use over and over as your child goes through school. Tips on things like starting an IEP binder, getting your issues on the agenda, drafting your child's IEP program, to sign or not sign, will become more comfortable as you learn more about the process. This is one book no "Special Ed" parent should be without. —*Joy Liebeskind*

Joy Liebeskind is the Director of the PATH Parent Resource Library which is part of the Connecticut statewide parent network.

Both of these titles are available through the EP Library (800) 535-1910.

The Early Intervention Dictionary can be ordered by using Item Code: WB030EI at a cost of $17.95 plus shipping and handling

The Complete IEP Guide can be ordered by using Item Code: NL001SE at a cost of $24.95 plus shipping and handling.

CALENDAR OF EVENTS

MARCH 3-5

Third Annual Council of Parent Attorneys and Advocates

Adam's Mark Hotel Houston, TX.

Topics will include an introduction to IEP basics and strategies and techniques to use in negotiating an IEP. For more information call: (954) 966-4489; Web site: http://www.copaa.net

MARCH 5-8

continued from page 14

be funded in full by Medtronic. NORD will administer the program, review completed applications, and award benefits based on applicants' financial need. Applications for the Medtronic ITB Therapy Patient Assistance Program can be obtained by calling NORD at (800) 999-6673, or (203) 746-6518. More information about Medtronic ITB Therapy is available on the Internet at http://www.itbtherapy.com.

Legislative update

On November 18, 1999, the conference report for the Work Incentives Improvement Act of 1999 was passed by the House of Representatives by an overwhelming bipartisan vote of 418 to 2. One day later, the Senate passed the act by a vote of 95 to 1. On December 17, 1999, President Clinton signed the Act into law. This new legislation will allow people with disabilities to retain their Medicare benefits longer than in the past and will remove the limits on the Medicaid buy-in option for workers with disabilities. The law also provides $250 million to states for demonstration programs to assess the health and financial benefits of providing Medicaid coverage to people whose condition has not yet deteriorated enough to prevent work, but who need healthcare to prevent deterioration. The Act is expected to enable more people with disabilities to participate in the workforce without fear of losing their Medicaid benefits.

New site offers service for viewing baby pictures

Parents can now share their pride and joy with the help of a new Internet-based service. The Internet site, http://www.babieshomepage.com, allows parents to create personalized Web sites with their child's pictures. This site is designed to provide distant family and friends with an easy way to exchange the latest images of their children over the Internet. Friends and relatives can visit the one location to see the latest pictures that are posted.

Easter Seals of southern California launches new Web site

Easter Seals of southern California has launched a new Web site at http://www.essc .org. The new site features easy access to information about Easter Seals services for children and adults with disabilities that are available in southern California communities. With just a click of the mouse, Internet users can find descriptions and locations of Easter Seals programs that offer day care for children with disabilities, job training and placement for adults with disabilities, services for seniors, and more. The Web site offers another valuable community resource through its "Dear Lily" section, where Web surfers can get advice and referrals on disability-related topics and organizations. This new Web site serves as a valuable source of information for individuals seeking local, disability-related services and information. Easter Seals of southern California is a nonprofit organization that provides over 100 programs and services that help people with disabilities live with equality, dignity, and independence.

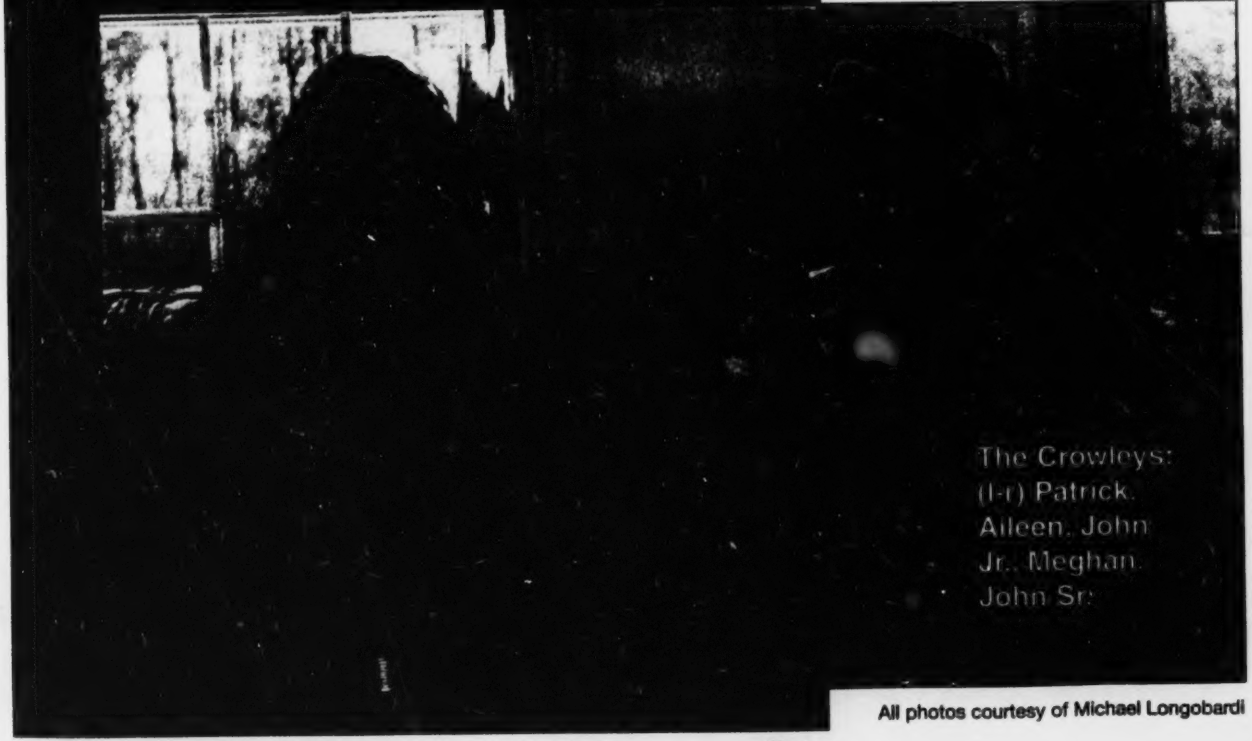
EP

EXCEPTIONAL PARENT'S HALL OF FAME 2000

John and Aileen Crowley are the parents of three children: John Jr., 4, Megan, 3, and Patrick, 18 months. This ordinarily busy household is complicated by the serious and rare illness Pompe's disease, that affects the younger two children. The Crowleys have done a remarkable job of managing the many challenges they face on a daily basis. They were willing to share their expertise with EP. We will present their experiences (in two parts) in their own words.

In this article, the Crowleys discuss their perspective on their children and their therapies, the coordination of the various professionals who are involved in their care, and the need for respite. They have also had the energy to create The Children's Pompe Foundation, which has contributed money to important research on Pompe's disease.



The Crowleys: (l-r) Patrick, Aileen, John Jr., Meghan, John Sr.

All photos courtesy of Michael Longobardi

Strength in the Face of Adversity

How one family meets the challenge of debilitating illness

STAYING POSITIVE

Raising three young children is a strenuous task under the best of circumstances. John and Aileen Crowley have two children who require 24-hour care for their survival. They live every day knowing that their children have a serious, potentially fatal disease, for which there is no cure. There are strangers in and out of their home all day. The enthusiasm and optimism of the Crowleys supports not only their family, but everyone who comes into contact with them.

JOHN CROWLEY: You get most of your strength from the kids. You can stay up until 2 in the morning working on foundation stuff and have to get up at 5:30AM the next day for work. You are tired and frustrated but you go into the bedroom and look into their eyes and realize time is your greatest enemy. That gives you all the determination you need in the world.

We give each other a lot of support. We have a lot of friends and family and a whole extended network of folks who have been usually supportive and helped pick us up when we are down. They reinforce all the positive aspects of what we are trying to do. We stay positive for ourselves, to keep us driving forward, but more so for the children. Their drive and spirit are so important in keeping them healthy. This will help them to have the will to fight and stay as strong as possible. We try to keep them as happy and pleasant as possible.

When Megan was first diagnosed, John and Aileen were immediately surrounded by an outpouring of support from friends and family.

JOHN: From the beginning, we shared the diagnosis and the doctors' comments with our families. Some of it was very explicitly stated, some of it was never said. We always felt that we would do everything in our power to change this. That was from literally within the first hour of the diagnosis, after the shock and the grief. Everybody in their own ways did everything they could to help contribute toward that effort. From Aileen's dad getting on a plane to go to California (where they then lived) within an hour, to my mother immediately getting on the Internet and typing in Pompe's disease, something we had never heard of, which helped us find out there are researchers out there and there was some hope.

JOHN: It's kind of instinctive, some people are enormously helpful. I had friends that I had not heard from in years who called to tell me their uncle is a pediatrician in Des Moines, if we needed to talk to anybody.

AILEEN CROWLEY: Some people just didn't know what to do. My younger brother, who lives in Chicago, said "I don't know what to do, what can I do to help?" People want to do something; they just don't know what.

TREATMENT PROGRAMS FOR THE CHILDREN

Megan and Patrick are both ventilator-dependent, use feeding tubes, and receive respiratory therapy. Megan has a teacher who comes to the Crowley's home. The children also receive care through the state's early-intervention program, Project Child.

AILEEN: Megan and Patrick get most of their therapies through Project Child. They've been wonderful. Some of the other families didn't even know about that. I told them you have to get in touch with this in your own state. They couldn't pay for a physical therapist and I told them they didn't have to, the state will do that for you. Megan is now considered "school-age," so the county pays for her schooling. She is of age now to be in preschool, and since she can't attend, they pay for a teacher at our home. She loves it. Having good teachers and therapists are key too. She loves her teacher, Miss Laura.

continued on page 24

continued from page 23

JOHN: Megan is the most intellectual and curious child you will ever meet and receptive—she started learning sign language when she was 14- or 15-months old. She knows hundreds of words now, and she uses it to communicate with us because of the muscle weakness in her mouth. We talk to her just as you would to any 3-year-old. In fact, she is a little more than precocious, and she talks back to us in sign language.

AILEEN: She's starting to use an attachment for her vent that helps her make sounds. We just got it two weeks ago, so she is just hearing her voice and being able to make sounds for the first time. It was nice. She's like a sponge; she can't learn enough. She's a good kid, and she just decided that her name isn't Megan anymore, it's Meg.

JOHN: Somebody taught her the sign for Meg, and she decided she wanted to be called Meg. She will correct you if you call her Megan. We held a fund raiser in New York a few weeks ago where we were fortunate to have Ben Vereen as a guest speaker. Up on stage, every time he would refer to her as Megan, she would turn around and do her sign for Meg.

She's a fighter, otherwise she wouldn't be alive. When Megan or Patrick are taken upstairs or downstairs, or to the car, their ventilators are disconnected for the brief time they are in transit. These lifesaving machines require frequent maintenance and surveillance.

AILEEN: She wears a ventilator while she sleeps, which forces air into her. When we transfer her, she doesn't tolerate it for very long, just to take her up and down the stairs or out to the car. Then we hook her back on. We have two ventilators, one upstairs, one down. They weigh forty pounds. We get them changed very often; you have to have a back-up in case one goes.

The respiratory therapist comes out every two to three weeks and he checks everything. One day Patrick was downstairs and the vent was not working; it just kept going out for whatever reason. Within two hours, they were there with a new ventilator. This is life and death.

SIBLINGS MATTER

John Crowley, Jr. is the big brother to his two younger siblings. It is challenging for a child to live with two siblings who are seriously ill. John and Aileen, however, have shared their wonderful, positive attitude with John Jr., who is not in the least uncertain about Megan and Patrick's future.

JOHN: I think Megan and Patrick are the center of all this. John is usually quite directly in the center.

AILEEN: He's old enough to know that Megan and Patrick are different. He knows everybody that was here this morning were for Megan and Patrick. He understands that and he deals with that in his own way. We try to make him feel special and make him stand out. He knows but he does not understand.

JOHN: John accepts that Megan and Patrick are sick and he has never known any different than that. He also believes, more than anyone else in this world, that they are going to be better. That is what we tell him, that they are going to grow up and they are going to be better, and doctors are working on special medicine. He never asks why. He just assumes they are going to grow up and they are going to be better, that they are going to go running with him and play ball with him, and swim with him.

AILEEN: We kept telling him we have done so much work on this foundation dinner in New York, it took a lot of both our time. I kept saying that Mommy has a meeting or daddy has to go somewhere. We say it's for a party for Megan and Patrick so we can get money for the doctors to get them a special medicine so they can run just like you and get rid of the machines. He was asking me the day after the fund raiser, "can we get rid of those 'sheens' now, mommy? Can we throw their 'sheens' away?" I said, "Oh no, not yet."

ABOUT POMPE'S DISEASE AND THE CHILDREN'S POMPE FOUNDATION

Pompe's disease is a rare, muscular disorder. It is caused by a genetic defect preventing the body from producing a crucial enzyme called acid maltase. In healthy individuals, acid maltase breaks down sugars that are stored in the body's muscle cells. In Pompe's disease, the absence or insufficiency of acid maltase forces the body to continually store sugar in the muscle cells in the form of glycogen. Glycogen storage rapidly causes the muscle cells to deteriorate. This results in progressive weakening and deterioration of the muscles. Glycogen also accumulates in the liver, muscles, nerves, and heart, preventing them from functioning properly.

For children diagnosed at an early age, death from Pompe-related complications, usually respiratory or cardiac in nature, typically occurs before age five. Less severe forms of Pompe's disease affect older children and adults and cause weakness of the arms and legs and diminished ability to breathe.

The Children's Pompe Foundation, a not-for-profit foundation established in 1998 by the Crowleys and other parents, relatives, and friends of children with Pompe's disease, is dedicated to funding research and meeting the needs of children with Pompe's disease. The Children's Pompe Foundation has already raised more than $1 million, which has been distributed in the form of grants to various centers conducting research and trials for Pompe's disease. Currently, the treatment being studied is acid maltase enzyme replacement; gene therapy is also being evaluated for use in the future.

Dr. Frank Martiniuk is a researcher at NYU Medical Center in New York City, who has been studying Pompe's disease and enzyme replacement for nearly 25 years. Dr. Martiniuk said that a major concern in conducting research is generating awareness among the public. He went on to say, "I think that there is enough interest [in Pompe's disease] right now, because of people like the Crowleys. These diseases are relatively rare, and it takes people like them to get things going."

Circle #53

Relaxing together, Patrick, Meg, and John take in some TV.

continued from page 24

JOHN: John Jr. doesn't have even the slightest bit of doubt in his mind as to whether science will work or whether it will work in time. He honestly, truly believes it's going to happen. John has his own needs like any child has, and that takes quite a bit of our time as well. But it's an effort, and you have to make sure it happens.

MANAGING THE HOME TREATMENT TEAM

The Crowleys host a virtual army of nurses, therapists, and other professionals throughout the day and night who all help care for Megan and Patrick.

AILEEN: They have physical therapists, speech therapists, and occupational therapists. Megan has a schoolteacher.

JOHN: The schoolteacher comes here.

AILEEN: We have nurses. Respiratory therapists.

JOHN: The occasional doctor who pays a house visit, which is very nice.

AILEEN: The medical supply company is here once a week, bringing all the medical supplies. The early intervention program staffers are building a special chair for Patrick, because he can't sit by himself anymore. They have built from cardboard, from scratch, a chair especially for him. We looked at chairs; they are close to $1,000.00.

RESPITE

Although John and Aileen maintain an unflagging optimism in their daily lives, they readily admit that they need to get away once in a while. The stresses involved in caring for Megan and Patrick, as well as working on the Children's Pompe Foundation, take their toll both physically and emotionally. Taking a break and relaxing allows them to function better and regain their stamina.

JOHN: We took our first vacation a couple of weeks ago since Megan was diagnosed a year and a half or two years ago. We went away for four days. To do that requires months of planning and we had two nurses here full time and two relatives and a nanny. We had a whole house of people to take care of the crew.

AILEEN: We are fortunate that we can do that, that we have people we can trust so that we can go away.

JOHN: It's always on your mind. We were able to relax knowing that we have such caring and quality people here. Even so, the kids are so inherently unstable that you are always concerned about them. We didn't find out until we got home, as we were flying back on the plane, that Megan was up with one of the nurses and her tracheotomy tube popped

Free Tranquility® Sample

Tranquility's New All-Through-the-Night (ATN) Disposable Briefs have extraordinary capacities—**now 50% more absorbent than before!**

- Your child can sleep all night uninterrupted by brief changes or leakage!
- The ATN Disposable Briefs feature a wetness indicator that blurs and then disappears after its been used.
- Kufguards®—lycra, multi-strand leg gathers—prevent leakage!
- Super Absorbent Peach Mat Protection Zone is guaranteed to keep your child's skin dry and eliminate odor.

Circle #28

out. They couldn't get it back in. Megan turned blue, then purple, then black, and they did CPR. Sharon, who is the greatest nurse in the world, was crying when she told us this. She said, "I'm sorry. I thought I lost her."

So there is never a completely peaceful moment. Sometimes you need to step away from it, the environment, and you don't even realize it. The environment and the innate pressure here is quite a bit. Sometimes you need to get away, get out of the house, get a bite to eat.

AILEEN: We go out to dinner a lot, at least once a week, once the kids are asleep, the nurse is upstairs and all the kids are asleep. We will go out for dinner, get out of the house, which we need.

I also go out with John; I try to balance it out because John needs to get out of here. You can't keep a 4-year-old locked up in the house with two sick kids, so we really try to get him out. I am fortunate that I can trust the nurses, but I always feel that I am being pulled in both directions. Patrick and Megan are crying as I am walking out the front door with John, and if I stayed with them he would be crying because he wants me to go with him. It's very difficult balancing it all, and all I want to do is pick up Megan and Patrick and throw them in their car seats and have us all go out, but we can't do that without planning.

JOHN: You have to (take a break), no matter how determined you are, you will burn out. Sometimes that's hard, sometimes we will go weeks and weeks working hard, at work, with the family, and the foundation to the point where we don't even realize how tired we are getting. Sometimes it's friends or family that just have to say, you need to take a break, stop for a day.

It's hard because you don't want to stop, you feel every day you stop doing something is a day behind in getting the kids better. You just have to realize those days off recharge your energy and your enthusiasm and ultimately, your productivity and your output.

You are better with the kids too, you spend weeks and weeks on end, every day, tending to the kids. You get short with them, you get frustrated, and to have a day or two to be able to get refreshed, you are a better parent. **EP**

The Whole World in Her Hands

Stephanie was born with more obstacles to overcome than most people. Early in life, she was diagnosed with bilateral club foot, scoliosis, spina bifida, hydrocephalus, severe hearing loss, mental retardation, and seizure disorder. For her, these conditions were not obstacles, but challenges. She set herself a goal: to live as independently as possible. But she would need help.

At the age of 15 she came to Heartspring School. Her multidisciplinary team helped her identify specific objectives within her larger plan, then develop the skills to accomplish them. In the home setting she learned to prepare meals, wash her clothes and iron them, groom and dress herself … handle her own daily medical care. At school and out in the community she honed her communication skills, polished her ability to read body language and situational context. She learned how to shop for groceries with the help of picture cards. She took a job in a local restaurant, practiced a solid work ethic, and enjoyed the rewards of earning a living.

This past summer, when Stephanie graduated from Heartspring School at the age of 21, her certificate of completion meant far more than an ordinary diploma. It meant living more independently, caring for herself, holding a job … participating in the community and the world.

If you know a child who could use some help with the challenges of living independently, call Heartspring School.

EXCEPTIONAL PROFESSIONALS

Techno-Daycare

Nurse Janet Carroll is the EXCEPTIONAL PROFESSIONAL behind Nurses 'n Kids, Inc., daycare that provides a cost-effective alternative to extended hospital stays for children who are technology dependent.

Witnessing the smiles and giggles of the children seated at the little tables at Nurses 'n Kids, Inc., in Delaware, observers might think they were standing in any daycare center. Nurses 'n Kids, however, is a state-run pediatric daycare facility for children who are medically fragile.

Nurses 'n Kids was started by Janet Carroll, a pediatric nurse. Janet identified the need for such a program while working as a NICU (neonatal intensive care unit) nurse. Janet recalls her encounter with parents who were concerned over their daughter's pending discharge from the hospital. "The mother explained to me that the daycare center they had chosen for their daughter would not accept her because of her medical needs. Their daughter had been diagnosed with cerebral palsy and had several apneic episodes (the temporary cessation of breathing) while in the NICU, and therefore, would be going home on an apnea monitor. Both parents needed to work, so it was not an option for one of them to quit to take care of their child. That night, I went home and started thinking. There had to be options for this family and all other families who, unfortunately, would face similar crises."

How to make dreams come true

What Janet had in mind would not be simple, and would require major planning as well as backing from other sources, such as state government agencies. She did some research and found a program in Florida that provided the kind of high-level services she hoped to make available in Delaware. After visiting the facility there, she learned that it was made possible under legislation passed in Florida called Prescribed Pediatric Extended Care, or PPEC. Janet explains, "The purpose of PPEC was to reduce the financial burden associated with chronic illness; ease the loneliness of homebound isolation; and lower the number of hospital admissions for chronically ill children. Referrals to the facility came from hospitals and physicians."

Most children who receive services at PPEC centers require sophisticated technological interventions. Without this support, these children would have to remain hospitalized to receive the level of care they need, even though they are stable enough medically to be discharged. The costs associated with extended hospitalization can be devastating to a family. PPEC centers represent an alternative to this. Facilities are staffed by experienced pediatric nurses who can provide the prescribed technological care for their clients. In addition, prescribed therapies (physical, occupational, speech/oral, and motor) are provided on site by registered pediatric therapists. Centers

Happy faces at a Nurse 'n Kids center in Delaware.

support the children until they are healthy enough to enter mainstream child care.

According to Stephen Towne, RN, Director of Nursing at Nurses 'n Kids, shortly after the first PPEC Center was opened in the United States, independent evaluators found significant differences when healthcare expenditures of families with children receiving PPEC services were compared with control families—those whose children either remained hospitalized or were receiving in-home care. PPEC families also reported dramatically lower stress levels than those of the control families. Towne adds, "Results of this study support the cost effectiveness of PPEC."

Findings like these helped support PPEC as a worthwhile

continued on page 30

Community-based care for medically fragile children

It is estimated that about 1 million children in the United States have costly and disabling health conditions. 17,000 to 100,000of these children are technology dependent. For many years, children dependent on technology and medical intervention services lived in hospital settings for their entire lives. As a result of the prohibitive costs of hospitalization and long-term care, as well as concern for the quality of life of the children, community-based care programs are now being developed.

On average, costs of community-based services are one-third of those incurred through in-patient hospitalization. Community agencies have also found decreases in children's re-admissions to hospitals and decreases in family stress levels.

Establishing a program for families of children who are medically fragile can be both challenging and rewarding. Community service agencies must learn new skills and develop cooperative relationships with a wide variety of partners, especially family members. These agencies must also develop strategies that will ensure quality services at affordable costs.

The first step in establishing a program is to conduct community research regarding the needs of families (number of families, types of services desired, financial structure of families, etc.). It is imperative that family input into the design and structure of the program be solicited. For example, many families have reported that daycare-type services allow parents to regain their stamina during the day, so that they can meet the intense needs of their child when he or she is home.

Once plans for a program are in place, the developer of the program must check state licensing requirements. In some states, only licensed personnel (e.g., nurses) are permitted to administer medications or perform health-related tasks, whereas other states have made allowances under their health services code to allow trained respite providers to administer medications and perform some basic health-related tasks.

THE MELMARK SCHOOL

Where education and love go hand in hand...
expanding life's options for special children.

Approved private boarding and day school, serving children ages 4 through 21 with:

- *Neurological impairments*
- *Autism/pervasive development disorder*
- *Mild to profound mental retardation*
- *Medically fragile and/or complex*
- *Challenging behaviors*

Our services include:

- *High student/teacher ratios*
- *Applied Behavior Analytic Programming*
- *Psychological, physical, speech, occupational, aquatic and hippotherapy*
- *On-site physicians*
- *24 Hour nursing*
- *Social, recreational & athletic programs*
- *Multi-sensory stimulation*
- *Family support services*
- *Community activities*

We also provide:

- *Respite Care (a vacation customized to student's needs)*
- *Summer Camp*

continued from page 29

endeavor. Working with Delaware's Department of Health and Social Services, Janet enabled similar PPEC laws to be introduced into the state legislature. Janet was subsequently asked to help develop the rules and regulations for PPEC in Delaware, paving the way for her dream to become reality. In 1988, Nurses 'n Kids opened its doors and has been growing ever since. Janet recalls, "In May 1990, the facility obtained a contract with Medicaid for PPEC, and soon the first expansion took place to accommodate the numbers of clients that needed PPEC services."

Above: Janet Carroll, founder of Nurses 'n kids, meets with staff members. Right: A child enjoys a game at Nurses 'n Kids.

Putting all the pieces together

As a family-centered program, Nurses 'n Kids is always trying to meet family needs. Dealing with insurance companies is not an easy task, so Nurses 'n Kids developed special procedure codes to facilitate handling insurance claims. Charges for Nurses 'n Kids services are determined by the level of care and number of therapies a child requires. Billing is done on a per diem basis, but third-party payers can be billed monthly or weekly.

...PARENTS OF A CHILD RECEIVING NURSES 'N KIDS SERVICES CAN ASSUME A MORE NORMAL LIFESTYLE OR RETURN TO WORK KNOWING THAT THEIR CHILD IS RECEIVING EXPERT AND LOVING CARE.

In addition to providing care, Nurses 'n Kids also provides parent training. Parents of children who attend receive instruction in both technological skills and child care. With this training, parents feel more confident of their ability to manage their child's medical needs. In addition, parents of a child receiving Nurses 'n Kids services can assume a more normal lifestyle or return to work knowing that their child is receiving expert and loving care.

When parents were uncomfortable transporting their children to the facility, Janet and the program's Managing Director, Gina McCoy, responded by initiating Nurses 'n Kids Transportation, Inc. Currently, the program transports PPEC clients throughout Delaware in specially equipped vans with a trained driver and nurse. According to Janet, "Parents began to ask if Nurses 'n Kids could provide home care so that they would not have to deal with so many agencies." Nurses 'n Kids at Home, Inc., providing standard and critical in-home care, was then born.

Janet sums up, "I had a dream many years ago, and as we strive to become a full service pediatric agency to provide and maintain a high level of excellence of care, we all believe in that dream. Each child is special." **EP**

To learn more about PPEC, or how to initiate the legislative proceedings to start a PPEC center in your state, call Janet Carroll, founder of Nurses 'n Kids, Inc., at: (302) 323-1436.

Who will care for your disabled child when you are gone?

Litigators Incorporated, P.C. & Affiliated Law Firms

ATTORNEYS ACROSS THE NATION

Dear Parents:

My sister died leaving behind a disabled child. If you have a child with a disability, the obligation for his or her care continues even after you are gone. My name is Jeff Brody, President of Litigators Incorporated, P.C. Let us help you find out if your child's disability was preventable; you could be entitled to substantial compensation for the lifetime care of your child. You owe it to your child to protect their future. There are time limits, please call me

PLACING YOUR CHILD WITH A DISABILITY IN DAYCARE:

Matching your child's needs with the right facility

By Patricia Durham, RN C. BSN

In 1990 the ADA (Americans with Disabilities Act) was passed. This law mandates accessibility for people with disabilities, including children. Some of the main issues of the ADA address architechtural barriers. Buildings built since 1990 must meet certain guidelines such as having wider doors for wheelchairs, accessible parking spaces and curb cuts.

Another area it addresses is public and private accessibility of services for people with disabilities. Thanks to this law, all children may attend daycare, sports events, concerts and other "normal" kid activities.

My daughter, Savannah Durham, who has chromsome18q- (a rare chromosomal deletion), was born in 1988, before the ADA. Savannah is legally blind, nonverbal, and nonambulatory. She has a congenital heart defect and a seizure disorder. She also has had respiratory and intestinal problems. Otherwise, Savannah is just like any other child. As a single working mother, I realized that daycare was essential. I took Savannah to several daycare centers, trying to get her enrolled. Interviews for enrollment were not always positive. As soon as Savannah's medical status and special needs were discussed, we were often turned away with phrases like, "We just can't handle her here," or "Because she takes extra time there will be extra cost," and "What will the other children think if we took care of her?"

After several unsuccessful attempts, I used a different approach. I did not phone and give information about Savannah and her disabilities. Instead, I dressed Savannah up, and we went to the daycare center in person. I introduced her by saying, "Here is Savannah! She is great and so easy to care for!" Instead of saying, "She is in a wheelchair and can't walk," I said, "In her wheelchair she is mobile enough to go outside and interact with the other kids." Instead of saying, "She doesn't talk," I said, "Savannah claps her hands to get your attention." I then followed with a thorough review of her nonverbal cues for the caregiver in charge of her.

If the daycare manager still seemed skeptical, I offered a two-week trial period. I knew that if they had the opportunity to work with Savannah, they would accept her. A trial period allows the center to work with your child and gives them the opportunity to view him or her as a child, not a disability. This benefits the parent also, because it provides you with the opportunity to observe and make an informed decision on whether that particular daycare center is right for your child.

Savannah (center), with her two primary caregivers, Kim Sparks and Megan Taylor.

Teacher Comments ______________________

Of course, if you get an outright "No, we don't take kids like that here," you have a few options. First, try explaining to the daycare center about the ADA law, and how your child has a right to be served. Second, try a collaborative approach with open communication. Most of the time, the center will be willing to work with you. It is more difficult when an adversarial relationship exists.

Sometimes, however, assertiveness is called for as a last resort. You can contact your local legal group for people with disabilities. These advocacy groups are often free and offer advice on these issues. *(See The Protection & Advocacy System at the end of this article.)*

continued on page 34

Patricia Durham, and her daughter, Savannah.

continued from page 33

Remember, perseverance pays off. Developing a true, working relationship takes time. What matters is that both the daycare center and parents are willing to work things out with open communication.

CAREGIVER STRATEGIES: TRAINING FOR DAYCARE STAFF

Most children with disabilities utilize a host of experts in their everyday lives (e.g., physical therapy, speech therapy, occupational therapy, case managers, in-home trainers and others). Ask some of these specialists to help train the daycare staff. Most of the apprehension felt by the daycare center is related to a feeling of not knowing how to adequately care for a child with disabilities. For example, I scheduled Savannah's speech therapist to go to the daycare twice a week, to feed her lunch, and to assist the daycare staff with any feeding concerns. You may want the physical therapist to instruct the staff on different ways of positioning your child and using good body mechanics to prevent muscle strain. Demonstrating to the staff how you care for your child is also helpful. By observing how you position your child

CHILD CARE OPTIONS FOR WORKING MOTHERS

REGULAR DAYCARE—Where your child would be if they were nondisabled.

EXTENDED FAMILY—For emergencies. Many grandparents also work.

RESPITE SERVICES—From your local state or county Department of Human Services Division of Developmental Disabilities, or other community service. This can include one to two hours coverage or several days for vacation. Call your insurance carrier and find out how you are covered for respite. ***TIP:*** Fill out the forms and try the service before you really need it. Realize that most respite programs have waiting lists.

HOME AND COMMUNITY SERVICE—A program through Mental Health and Mental Retardation, where a person (in-home trainer) comes to your home and works with your child on activities of daily living such as feeding, bathing, playing, etc. This type of service usually has an extremely long waiting list.

COLLEGE STUDENTS—
******BEST BET******
Particularly students who are majoring in speech, occupational, or physical therapy. Others may include special education or human services majors. Post an advertisement at your local college. Some majors are required to volunteer a cetain number of hours working with people with disabilities.

"When our child was first diagnosed, I fell apart. Then I heard about SNAP... it was a lifesaver."
— P.P., Los Angeles, CA

"Knowing my son's future will be financially secure is an enormous relief; I can't thank you enough."
— R.M., Cleveland, OH

Whether you need estate planning, medical insurance advocacy, or legal and other referrals, SNAP —Special Needs Advocate for Parents— can help. We provide:

- Special needs estate planning through seminars and consultations with certified special needs advisors
- Referrals to educational advocates, support groups and others
- A directory of attorneys with expertise in special needs practice
- Medical insurance problem solving

and how you communicate, they pick up helpful information. Of course, the daycare staff should already have formal training in CPR and first-aid.

If your child is fortunate enough to have an in-home trainer or other support person caring for them, send that person to the daycare center to offer help during peak times.

Savannah is in a regular room with her peers. Initially, the daycare center had wanted to place her in the infant room. I disagreed, knowing how important age-appropriate interactions are to all children.

CLASSMATES

When children first meet Savannah, they are curious. I answer questions freely to help them understand her condition. Many children like "helping" Savannah play. She loves the attention she receives from the other children.

COMMUNICATION

Communication between the caregiver and parent is essential. Savannah is nonverbal and cannot relay information; therefore, communication between her caregiver and me was critical. I would drop Savannah off at 6:00 am and pick her up at 4:00 pm During the day, she may have had up to three different caregivers. I was frustrated when I asked the afternoon caregiver how the morning was, and she did not know. A simple solution was to use a clipboard to record her progress during the day.

I found that a checklist was easier, because most caregivers do not like having to write down the entire day's events. Notes to certain teachers can also be written on the clipboard.

Finding the right daycare center for your child may be challenging, but it will give you peace of mind, and your child an enjoyable and caring environment.

Patricia Durham, RN C. BSN, is a registered nurse and Savannah's mother. They live in Lubbock, Texas.

TRANQUILITY

Now Your Child Can Wake Up Dry Every Morning!

With Tranquility disposable briefs, mornings can be easier for both you and your child, because Tranquility absorbs more urine without damaging tender skin. Rated number one by medical professionals, Tranquility is simply the best brief for your special child.

Tranquility's superior capacity means fewer changes and better skin all day long, too!

- Eliminates urine odor
- Latex-free
- Higher capacity
- Better skin protection

Free Samples

See the complete line of Tranquility products and order free samples at our website: www.gopeach.com, or call us, Principle Business Enterprises, for your free samples at 1(800)467-3224.

Try Tranquility incontinence products, and make every morning a good morning for you and your child.

World Congress Vision Becomes Clear as Leaders Shape Program

The road to Atlanta is paved with...cooperation, enthusiasm, and commitment. As the old year, century, and such prepared to turn, the advisory/steering committee of the World Congress & Exposition on Disabilities (WCD) met for the first time. WCD, set to take place November 10 to 12 at the Georgia International Convention Center in Atlanta, has a unique, multifaceted orientation: uniting personal, family, and professional concerns and information in one conference on disabilities. It promises to combine the educational aspects of an international professional conference, the advocacy and "how to" of a families forum, and the in-depth product and service information of a trade exhibition.

Working together

The 19-member advisory/steering committee—including physicians, parents, educators, association leaders, advocates, and government office representatives—reflects WCD's unified approach. Its goal is a three-track agenda compatible with the educational interests of individuals with disabilities, their families and caregivers, and both the educators and healthcare professionals who work with them.

During the day-long meeting to hammer out both approach and detail, physicians, opinion leaders, special education professionals, and caregivers worked hand-in-hand to create a uniquely powerful education event with topics relevant to each other, yet positioned to offer value to each group. Professionals in the room listened attentively to parents, advocates to policy makers, caregivers to practitioners. They not only agreed on the importance of others' points and perspectives, but also bought into their inclusion as critical agenda items.

Joe Valenzano—Conference Director and CEO, President and Publisher of Exceptional Parent magazine—delighted in the committee's first efforts. "Never before in my 25 years in the healthcare industry have I witnessed what I saw there. Everyone approached this challenging task with enthusiasm, commitment, and a belief in the value of what we are trying to accomplish. This is unique, especially in a group so talented and with such diverse backgrounds—and where many had not even met until that day."

A work in progress

For parents and other caregivers, WCD will present exciting new medical developments, as well as information on critical family and community issues. Workshops and seminars will increase skills in such areas as dealing with insurance companies, building advocacy or support groups, contacting and working with both government officials and the media, and using the Internet for information and advocacy. Special pavilions are planned for vision and dental screening and employment contacts for people with disabilities.

For professionals, a key element will be opportunities to meet and share information, ideas and effective practices with colleagues from around the world. With CME and CEU credits being offered, there will be workshops in advocacy, seminars in office and clinic management, networking with government officials, and identification of important professional and family resources.

Both formal and informal gatherings will encourage all participants to share ideas, approaches, and information. Meanwhile, an exhibition hall of 200 vendors will be open for perusal, discussion, and ideas for the future.

Exposition on Disabilities

The first international forum of "information that matters from people who care" for people who care: families and professionals in science, medicine, education and advocacy.

November 10-12, 2000, Atlanta, Georgia

Exceptional Parent Magazine and H.A. Bruno, LLC invite families of people with disabilities and professionals from the fields of healthcare and education from across the United States, Canada and around the world to share information, strategies, experiences, ideas and innovations.

WORLD CONGRESS & EXPOSITION ON DISABILITIES
WCD

A World-Class Weekend

Join forces and voices for people with disabilities

SYMBOL OF EXCELLENCE EXCEPTIONAL PARENT
EP

For Families and Caregivers: Experienced parents and professionals share first-hand, hands-on and first-person strategies and techniques for planning and problem solving in the home, the family, the community and the world at large. 400 associations are invited to share programs, projects and advocacy ideas.
Agenda items: insurance, schools, recreation, estate-planning, health care providers, employment, assessibility, technology, and many more.

For Physicians, Physical Therapists, Occupational Therapists and Educators: International experts discuss movement and brain disorders in symposia, lecture and workshop settings. Emory University's School of Medicine provides CME and CEU credits and administers a call for papers. Professional associations are also invited.
Agenda items: ataxias, spasticity, Tourette, Parkinson's, epilepsy, AD/HD, newborn screening for inborn metabolic errors, mitochondrial diseases, infant nutrition, learning disabilities, and many more.

For Those with Disabilities: Opportunities for information and hands-on introductions to the latest innovations in technology, health care, fun and advocacy.
Agenda items: Free dental and vision screening, hands-on workshops in technology and educational software, sports and recreation pavilion, Career Fair featuring live interviews with major corporations, the best toys, games and videos for fun and educational use and many more.

WORLD CONGRESS & EXPOSITION ON DISABILITIES STEERING/ADVISORY COMMITTEE

Various leaders from different corners of the disabilities field gathered recently in Rockville, MD to help crystallize a vision that has been in the works for more than two years. This elite group of individuals included parents, direct service providers, association executives, physicians and educators as well as government health-care professionals.

The all-day session resulted in the creation of a cross-educational program that will bring together people with disabilities, their families, direct service providers, educators and healthcare professionals. It was, according to those in attendance, precedent-setting.

"I honestly believe we accomplished more than I could have hoped for at this first gathering of the people we very much are relying upon to help us create this dream," said Joe Valenzano, CEO, President and Publisher of Exceptional Parent magazine and Conference Director of WCD.

The WCD Steering/Advisory Committee includes: **Judy Blazer**, We Move; **Dr. Joe Botti**, National Perinatal Association; **Dr. Mitchell Brin**, Mt. Sinai, We Move and the Movement Disorders Society; **Cindy Brownstein**, Epilepsy Foundation; **Victor Erickson**, Council for Exceptional Children; **Dr. Steve Groft**, Office of Rare Diseases, National Institutes of Health; **Dave Harmon**, MetLife; **Nancy Harris**, Harris Consultants ; **George Jesien**, Ph.D., American Association of University Affiliated Programs for People with Developmental Disabilities; **Julie Keys**, Family Voices; **Valerie Levitan**, Ph. D., Dystonia Medical Research Foundation; **Dr. Merle McPherson**, Health Resources and Services Administration; **Suzanne Mintz**, National Family Caregivers Association; **Dr. Diane Moddeman**, Canadian Pediatric Society; **Frank Murphy**, National Down Syndrome Congress; **Dr. Rick Rader**, Morton J. Childcare for Children with Special Needs

by Shelli Yesenko

The Americans with Disabilities Act requires all childcare programs to make reasonable efforts to accommodate children with disabilities, unless doing so would be excessively difficult or expensive or would change the basic nature of the childcare program. While many childcare centers are willing to accept children with special needs, parents need to make sure that these facilities are staffed and equipped appropriately to provide the range and level of care their child with special needs requires. Following are some suggested questions and general guidelines on the type of responses parents should be looking for from childcare providers. It may also be helpful to discuss the child's specific needs with their physicians and therapists so that questions can be tailored to address those areas.

Q Has your center served other children with special needs?

A A "no" answer should not immediately eliminate the childcare center as a resource, but should open the door for questions about its capability to provide the extent of care and attention the child might require. A "yes" answer should lead to discussion on how the special needs of the other children are or have been accommodated, and the level of experience and/or training the staff has in this area.

Q Do you feel your childcare center has sufficient staff to serve children with special needs?

A The staff-to-child ratio at the center is an important gauge. A center with only minimum staffing may have difficulty providing the extra care required by some children with special needs.

Q Are therapy services (such as speech, occupational, or physical therapy) an integral part of the program, or can these services be provided on-site by an outside resource?

A Some childcare programs integrate these services or allow outside resources to augment their regular program.

Q Is the staff who will be caring for my child willing to talk with my child's pediatrician or other specialists?

A It is important that the caregivers for a child with special needs communicate with each other and coordinate their caregiving strategy.

Q Does your childcare center have access to the types of specialized equipment my child requires?

A In most cases, the answer will be "no." In this instance, the parents and caregivers will need to work together to secure any specialized equipment or adapt the equipment already available. The family's insurance company or another resource may provide the equipment. An important follow-up question to ask is whether the staff is willing to be trained in how to use and maintain equipment properly.

Q Are progress notes kept on each child?

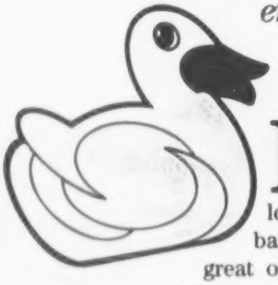
A If regular feedback is important to you, work with the childcare staff to develop a mutually acceptable system for tracking your child's activities during the day. Finding the right childcare program does not end at the point of enrollment. Caring, experienced childcare providers know that ongoing communication between parents and providers is one of the most important factors in ensuring the health and happiness of your child.

Shelli Yesenko is the Program Director for Within My World at PACT: Helping Children with Special Needs, Inc. PACT is affiliated with the Kennedy Krieger Institute, Baltimore, MD, and is a non profit children's organization providing early-intervention services and specialized childcare programs.

Creating Play Environments

by The Let's Play! Project

The Let's Play! Project specializes in creating and adapting environments to enable children to play. While their area of focus is on young children (ages birth to 2) many of these bath-time activities can be useful and enjoyable for older children as well. It's all good, clean fun!



For children who already love the water, bath time is a great opportunity to increase their experiences with movement, learning, and imagination. For children who are not enthusiastic about bath time, play activities may diminish anxiety, especially if they feel "in control" of the activities.

Of course, it is essential that the child be safe in the water before he or she plays. There are a number of commercially available tub seats for young children. For older children who require supports, a bath seat may need to be ordered from a specialty catalog.

Once a child is properly supported, let the games begin!!!! Water is a wonderful sensory medium as it "responds" to virtually any movement. For the young child, it may be fun to just splash by moving arms and legs in the water. The resistance of the water is a good way to increase muscle strength and the feedback your child will get is a "splash."

Bath time is a wonderful time to play with your child!

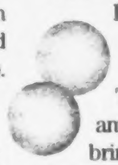
Games to play/materials to use

- Naming body parts is a classic tub game. Use a wash cloth, a bar of soap, a paintbrush, or foam soap to wash the body part your child has indicated. You can also put the child in charge of washing as you name the part to be washed. This can be a fun turn-taking game. With a paintbrush, your child can "paint" the tub with his or her body.
- Certain materials encourage water play: sponges for squeezing and wringing with two hands, cups to fill up and dump, or two cups to pour water back and forth between them and "mix" the water. Turkey basters are great for squeezing, and funnels are also interesting to pour water into and watch it come out.
- Consider using empty dish liquid bottles or spray bottles to squirt water. Have an older child squirt the water into an empty margarine container floating on the surface to "sink the ship," or aim at his or her toes.
- Another game which encourages eyes and hands to work together is using a fish net or ladle to scoop floating objects (plastic fish, ping-pong balls, etc.) out of the water. Also try putting a few ice cubes in the bath water. This will allow the child to

Bathtub Play

experiment with different temperatures and watch the ice cubes melt.

- Using foam soap or shaving cream at bath time can be fun. A child can use both hands to rub it on his/her body, the sides of the tub, and even on the walls (surfaces dependent). Try making handprints in the shaving cream using a paintbrush or a finger.
- Tub blocks, available in most toy stores, are fun in the water. When wet, these toys stick to shiny tub and wall surfaces. A younger child can catch the blocks as they float in the tub or push them down into the water and watch them pop up! He or she can also knock them down with his/her hand, a paintbrush or a spray bottle. An older child may enjoy creating a picture.
- To promote creative play scenarios, consider bringing small action figures and/or animals into the tub. By combining the figures with other tub toys, a variety of imaginative play scenes can be created (e.g. people on a boat, in a swimming pool, or even in a flood). Bringing a waterproof doll into the tub and washing the baby is also an imaginary play favorite. Tub time is wonderful for amateur cooks too. Consider bringing strainers, spoons, pots, and empty spice containers into the tub for a fun "cooking" experience.



Note...

The experiences described above do not have to be limited to the tub. In nice weather, many of these play activities can be done in a small wading pool. If you are really brave, you can create an indoor beach. Fill up a small pool in the house and put a shower curtain underneath it to protect the floor. Next to the water, set up a large cardboard box filled with dry beans or pasta for the "sand". Many of the water activities can also be done in the "sand." **EP**

CALL FOR DETAILS

Circle #34

In the December 1997 issue of Exceptional Parent magazine, Bubblicious® chewing gum and the organization Wing & Wheels Inc., a greeting card company which features individuals with special needs, announced a drawing contest for children with special needs. Contestants had to be between the ages of 6 and 17, and the drawing had to be a picture of a location anywhere in the United States. If selected as the Grand Prize Winner, the artist and his or her immediate family would win a vacation to that spot.

One hopeful contestant was budding artist, Bianca Andrews of Newark, New Jersey. Bianca, who has cerebral palsy, submitted a drawing of herself in sunny Hawaii. Over the summer, then 8-year old Bianca received an exciting phone call. Her drawing of Hawaii had been selected as the Grand Prize Winner. Bianca, mom Vivian, Aunt Melba, and cousin Amanda would be heading out to tropical Hawaii for a week of fun in the sun. According to Bianca, the things she was looking forward to the most were,"Watching the hula girls dance, eating coconuts, and swimming in the beautiful Pacific ocean" Bianca also confessed that the children at her school have treated her like a movie star, and some students even asked if they could accompany her!

Bianca and her family made that trip this past year. Recently, EP caught up with Bianca and her mother to find out how the trip went. According to Bianca's mom, they had a wonderful time and spent lots of time relaxing poolside. The group also had the opportunity to hula dance on stage. This truly was a dream vacation. At right is a letter that Bianca wrote to EP describing her time in Hawaii. **EP**

My Hawaiian vacation

by Bianca Andrews

I have always wanted to go to Hawaii, mostly because I wanted to see the hula dancers. I wanted to get up on stage with them and dance. When we went to the Luau. I got up on stage with my mom, cousin Amanda, and Aunt Melba to learn how to hula, which is not easy for me. This was the best part of my vacation. I also liked the beautiful beach and they had a great big swimming pool at the hotel where we stayed. We spent most of our day at the pool. I would say this vacation was a dream come true.

Bianca

Far left, Bianca, her mother, aunt, and cousin enjoy the sights and sounds of a Hawaiian Luau. Right, Bianca's smile says it all. This was a dream vacation.

At The New England Center for Children

each child's independence

is at the center of our attention.

There are many reasons why children come here, from all across the country, to The New England Center for Children.

They come for our nationally recognized educational, residential and treatment programs — all community based, all offered from one source. As a center of excellence, our efforts focus not on expanding into multiple locations, but on perfecting programs that will expand children's lives.

They come for our professional staff. Many are nationally known in the fields of autism and applied behavior analysis; all bring a special warmth and enthusiasm to everything from our preschool to our adolescent programs. Bringing to every child — your child — unwavering commitment. Each and every day.

They come and participate in services that range from intensive speech and language programs, to adaptive physical education, to employment training, to management of behavior problems.

And when, in time, each child leaves, individual potential has been reached, a new level of independence achieved.

Independence achieved through educational excellence.

At NECC, we welcome children diagnosed with autism, behavior disorders, learning disabilities, language delays, mental retardation and related disabilities. Nationally recognized for the success of our programs, we are equally well known for our dedication — on every level — to bringing about positive change in the lives of the children who come here. Change that helps them live more productively and independently, long after they leave.

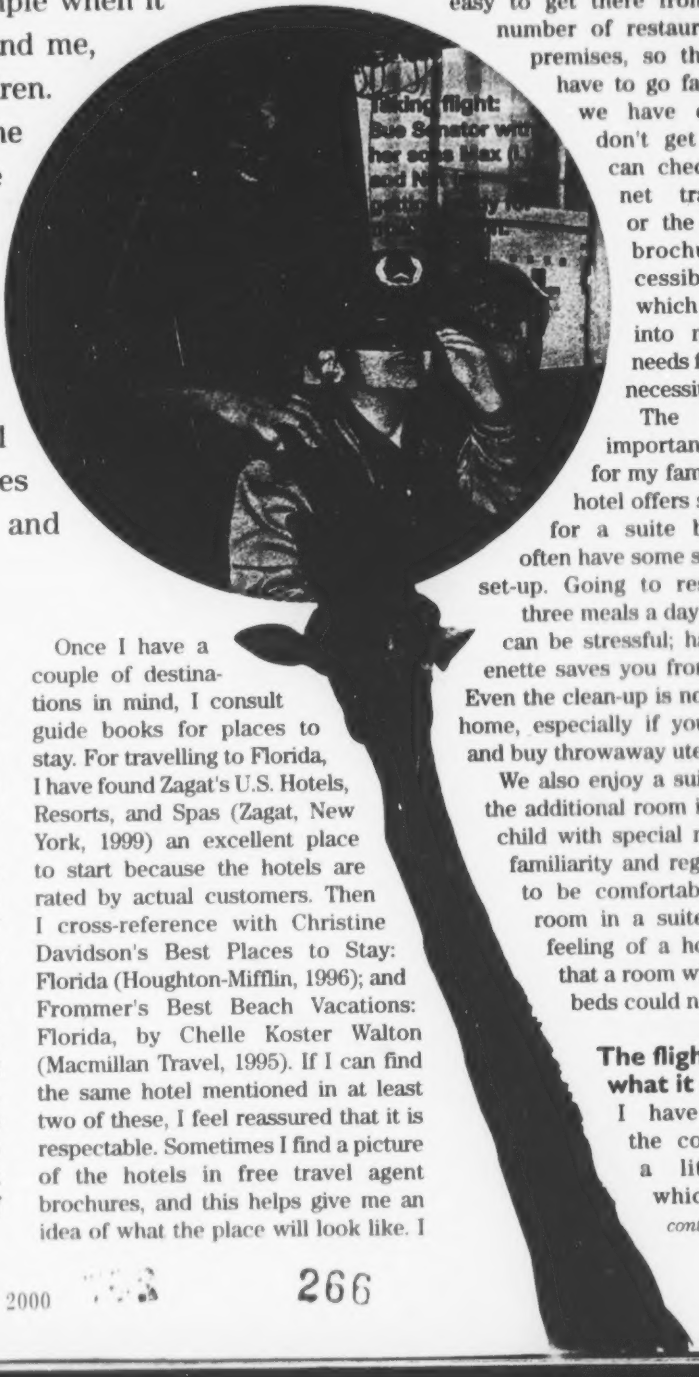
The Secret To Happy Vacations

By Susan Senator

Vacations were fairly simple when it was just my husband and me, but now we have three children. The oldest has autism, and the youngest is a toddler. Yet we manage to take one warm weather vacation a year, without a great deal of stress or unreasonable expense. There is an art to travelling with a special needs child, which lies partially in the details, and partially in attitude.



Destination: organizing our desires

When planning where we are going, I decide what is important for the grownups, and what is necessary for the children. Warm weather is first and foremost to my husband and me, so our destination is based on a hot climate. The kids will do fine there, too. It cannot be just any exotic hotspot, however; a six-hour flight to the Caribbean is out of the question for us. A flight that involves changing planes more than once is as well. We have always settled on Florida, but we go to different parts each year. I get an idea of travel times by looking through travel agent brochures, then going to a Web site like http://www.expedia.com or http://www.travelocity.com. That way I can get a general idea of the time and cost of flights before I commit to anything.

Once I have a couple of destinations in mind, I consult guide books for places to stay. For travelling to Florida, I have found Zagat's U.S. Hotels, Resorts, and Spas (Zagat, New York, 1999) an excellent place to start because the hotels are rated by actual customers. Then I cross-reference with Christine Davidson's Best Places to Stay: Florida (Houghton-Mifflin, 1996); and Frommer's Best Beach Vacations: Florida, by Chelle Koster Walton (Macmillan Travel, 1995). If I can find the same hotel mentioned in at least two of these, I feel reassured that it is respectable. Sometimes I find a picture of the hotels in free travel agent brochures, and this helps give me an idea of what the place will look like. I can use this picture later on when explaining to my child with special needs where we are going.

Accommodations

I choose the hotel based on a few things: whether the place has an interesting pool, so that the kids will have some exploring to do while swimming; proximity to the ocean, so that it is easy to get there from the room; number of restaurants on the premises, so that we don't have to go far to eat, but we have choices and don't get bored. You can check the Internet travel agents or the travel agent brochures for accessibility, too, which will figure into many special needs families' list of necessities.

The final, most important condition for my family is that the hotel offers suites. We opt for a suite because they often have some sort of kitchen set-up. Going to restaurants for three meals a day with children can be stressful; having a kitchenette saves you from that hassle. Even the clean-up is not as bad as at home, especially if you do take-out and buy throwaway utensils.

We also enjoy a suite because of the additional room it gives us. My child with special needs requires familiarity and regimen in order to be comfortable. The extra room in a suite conveys the feeling of a home in a way that a room with two double beds could not.

The flight: doing what it takes

I have found that the construction of a little booklet which I call "Crisis

continued on page 48

easy yet powerful communication aids by prentke romich company 800-262-1933 www.prentrom.com

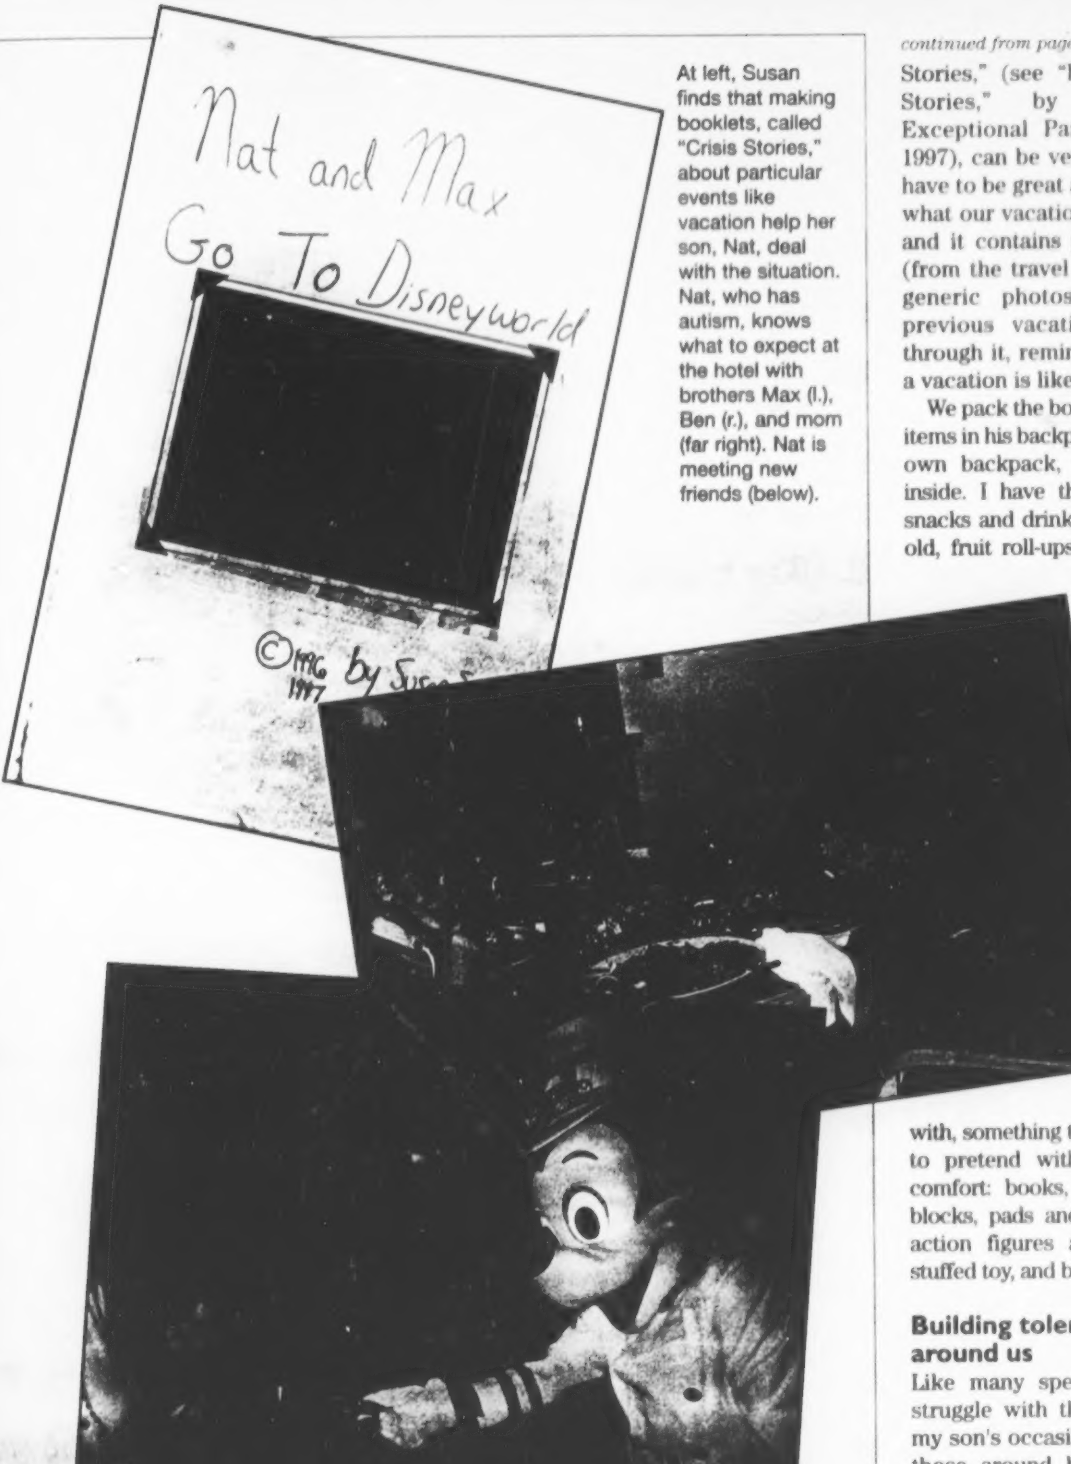
TIME SAVERS

INNOVATIONS SUCH AS DISTANCE LEARNING, LANGUAGE ACTIVITY MONITOR (LAM), AND THE PRC PICTURE SET ALLOW PROFESSIONALS TO SPEND THEIR TIME WHERE IT REALLY MATTERS.

PRC

We know you didn't go into your profession for the paperwork.

Circle #46



At left, Susan finds that making booklets, called "Crisis Stories," about particular events like vacation help her son, Nat, deal with the situation. Nat, who has autism, knows what to expect at the hotel with brothers Max (l.), Ben (r.), and mom (far right). Nat is meeting new friends (below).

continued from page 46

Stories," (see "How to Write Crisis Stories," by Susan Senator, Exceptional Parent Magazine, July 1997), can be very useful. It does not have to be great art; it merely explains what our vacation will be, and where, and it contains pictures of the hotel (from the travel agent brochure) and generic photos of my child on previous vacations. My son leafs through it, reminding himself of what a vacation is like, and what to expect.

We pack the booklet and other special items in his backpack. Each child has his own backpack, with his own things inside. I have them pack appropriate snacks and drinks—gum for my 7-year-old, fruit roll-ups for my son who has autism, who does not understand that you should not swallow gum, and a bottle for my toddler. As much as possible, I have them decide what they need to bring with them. This is the bag that holds all the toys for the entire trip, so it must be packed wisely. My general advice to them is to bring something to read, something to build with, something to draw with, something to pretend with, and something for comfort: books, a baggie of legos or blocks, pads and crayons, a couple of action figures and vehicles, a small stuffed toy, and blankies.

Building tolerance in those around us

Like many special needs parents, I struggle with the issue of explaining my son's occasionally odd behavior to those around him. When we travel, there are ways of telling without actually "telling." For instance, when we are boarding the plane, I speak to my son in a slightly louder voice than usual, complimenting him warmly when he follows my instructions. This way, people watching get the idea that something is a little different with this child. That's all they need to know. I make eye contact with anyone who stares, and I smile at them and at my son. Smiling goes a long way. I act happier than I may be feeling, and this helps relax my child(ren) and conveys ease and competence to the adults around me. They are then more likely to shrug off the occasional bump or kick, especially when I apologize and remind my child to apologize. This lets people know that we are working on these things; that this is not about "poor parenting" or "bad behavior." There will always be some people who will not understand, but we will not let this disrupt our vacation.

THE MORE FAMILIAR STRUCTURE MY CHILD WITH SPECIAL NEEDS HAS, THE LESS ANXIOUS HE FEELS, AND LESS PRONE HE IS TO DISRUPTIVE BEHAVIOR.

Special treatment

Many amusement or theme parks can be wonderful for kids with special needs. They are great because they strive to accommodate, and we have benefited from a special pass picked up at the ticket booth, which we got with a note from our doctor. I advise that you call ahead first and explain your situation; it is not a given that you will get the pass. Once you have the pass, your child will not have to endure most long lines that are hard for any child to take, but even harder for children with disabilities like autism and attention deficit disorder. Many of the attractions have separate entrances for people with disabilities, or a staff member simply escorts your child (and his family) to the front of the line! Be forewarned that some guests do not appreciate the situation of the special needs family. Our child has a disability you can't necessarily see, and this caused some visitors to question our actions. Try not to feel guilty; you have paid your dues already! For once, something has come easy for your child; take it and enjoy it!

Making routines

Our vacation success as a special needs family also comes down to getting into a routine each day. Meals are a good place to start. Take the same table in the corner each day, and eat lavishly for an hour for breakfast. Lunch is often the hardest to routinize, since we are likely to be out and about. We try to do the same thing each day for lunch, and save the variety for dinner. The front desk often has someone who is happy to direct you to local kid-friendly restaurants, if the hotel restaurant is too grownup for your family.

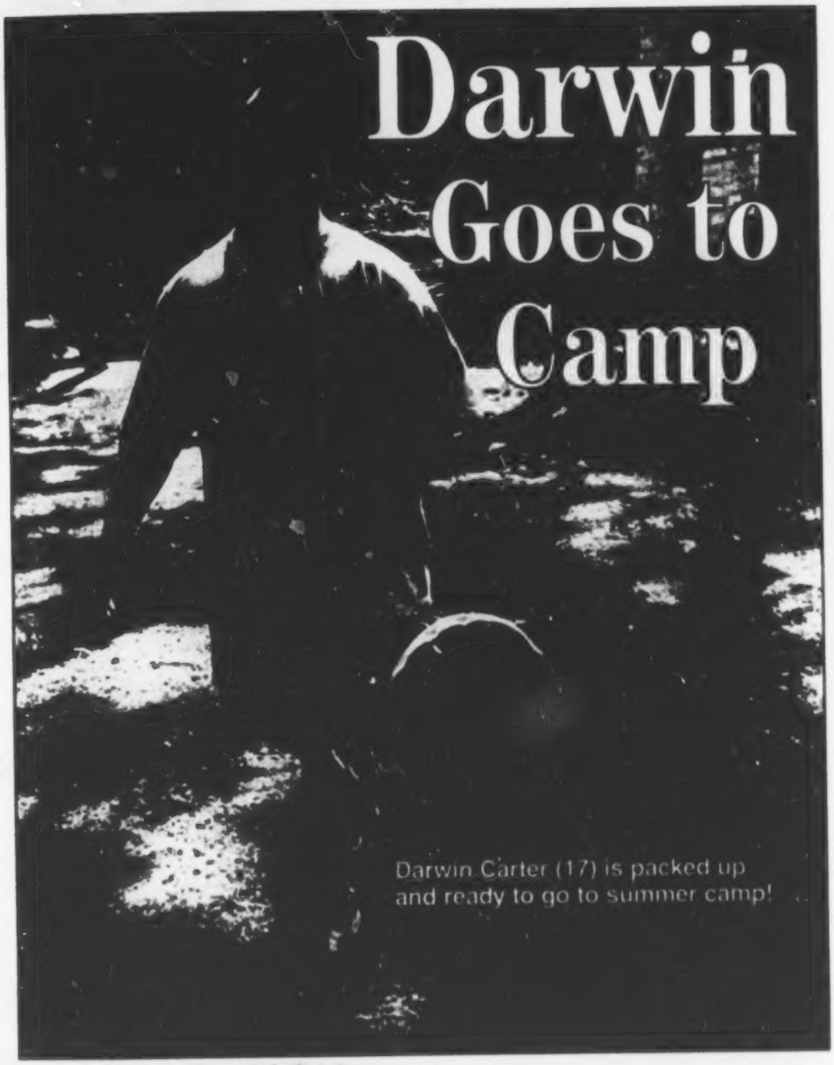
There are also the activity routines. Each morning, we try to outline our plan for the day, using visuals if we've got them. We explain when and where we will eat, where we will go first (pointing to the pool, the ocean, or using a hotel brochure picture), when we will come back to the room. The more familiar structure my child with special needs has, the less anxious he feels, and less prone he is to disruptive behavior. On the day of departure, we explain about the long plane ride, the waiting, the drive home, and finally, arriving at our house.

A vacation is yours to invent

Routines and schedule recitations are my son's anchors. As he repeats the items in order, and asks us to fill in the blanks, he begins to be soothed by their form and their content. Once he understands what will happen, he begins to relax, and then so do we. It's not always easy or smooth. By being aware of our priorities and adhering to them, we manage to take vacations like most families, without a lot of extra expense and worry. And by being cognizant of the unique strengths and weaknesses of our family, we find our own particular way of having fun and staying happy. I believe that any special needs family can come up with their own list of priorities and necessities for having fun, and succeed in taking the vacation of their dreams – or close to it. Special needs parents know more than anyone else that nothing is perfect, but you sure can try! **EP**

Susan Senator and her family live in Massachusetts, where Susan is the Co-chair of the Brookline Special Education Parents Advisory Committee.

Darwin Goes to Camp



Darwin Carter (17) is packed up and ready to go to summer camp!

CONFESSIONS OF AN ANXIOUS MOTHER

by Susanne Carter

It is 3 a.m. on a Sunday morning in late June, and I am wide awake with maternal anxiety. Although everyone else in the family is sleeping peacefully, I am trying to convince myself that I can overcome my apprehension and take my 17-year-old son (who has a unique combination of Down syndrome, autism, and severe mental retardation) to camp. If it is possible to both look forward to and dread something at the same time, this describes exactly how I feel right now.

Parting with Darwin

This is the day I have anticipated for months with excitement, like a child counting down the days to Christmas. This is my opportunity for five days of blissful freedom from Darwin's constant care. Just think...

- No diaper changes for five days;
- No middle-of-the-night interruptions for five days;
- No listening to the same rock music over and over and over for five days;
- No exciting "adventures" for five days, such as taking apart the toilet in search of the toothbrush that Darwin has flushed or trying to inconspicuously retrieve the underwear that he has abandoned and tossed over the fence into the neighbor's yard;
- Essentially no "Darwin duty" for FIVE WHOLE DAYS!

I am not sure I can part with him. I am already missing my son before we leave home. This will be Darwin's third summer at camp. You would think I would have adjusted to the separation by now. Although it has become easier each year, I always find it difficult to part with my son.

If only Darwin could somehow communicate to us that he wants to go to camp. If only he could anticipate this day with excitement, as I do.

Even a child with limited communication ability such as Darwin can express his preferences. Just try playing a Dire Straits CD when he is in the mood to rock to the Moody Blues and he will "tell" you something about preferences.

We try to build choice into Darwin's life at every opportunity, recognizing that it is self-empowering for him to be able to make his own choices. However, "camp" is not a tangible part of our family's regular routine, and Darwin does not have the ability to

relate with photographs or other forms of symbolism. For Darwin, going to camp is not a choice he can make for himself. It is one we are making for him— and for ourselves.

Now that the long-awaited day is here, the "what if" monster will not let me sleep:

- What if Darwin refuses to sleep and giggles all night, keeping everyone in his cabin awake all night?
- What if he escapes and no one can find him in the surrounding woods?
- What if Darwin's "evil twin brother" (as we affectionately refer to Darwin when he is in one of his mischievous phases) suddenly surfaces and becomes aggressive?
- What if he suddenly decides to take a dip in the pool in his birthday suit?

I know my son. I know any of these scenarios could easily happen.

Now that Darwin and I have survived three summers of separation, when he goes to camp and I reflect back upon our respective experiences, I realize the he and I both have come a long way in our adjustment to this new adventure.

The first year

The first year we sent Darwin to camp was understandably the hardest. We made a visit to the camp ahead of time with Darwin and liked what we saw. He would certainly enjoy the swimming pool, merry-go-round, basketball courts, hiking trails, nightly dances, rocking chairs outside of every cabin, and Snickers™ on demand at the canteen. We also had a lengthy discussion with the camp director, who assured us that the staff was experienced dealing with active, exploratory "Darwin-type" campers who require intensive on-on-one supervision. Despite these reassurances, I wasn't sure I could leave him, even if the camp met Darwin's utopian ideal of the perfect summer camp—pizza every meal and continuous rock music—or mine, Darwin mellow and happy every moment, and by the end of the week, talking in complete sentences and fully toilet-trained.

In his 17 years, Darwin had never spent a night away from home without us. We were about to leave him in a strange place with people who, although obviously caring and experienced in working with individuals with varying disabilities, hardly knew Darwin or his idiosyncrasies.

Parents of "normal" infants and toddlers experience a similar apprehension when they leave their children in new places or with new caregivers. Those of us with children who have severe disabilities like Darwin may never really move beyond this stage; our children grow up but essentially they remain infants in their inability to express their wants and needs., their helplessness, their

Survival Tips for Anxious Mothers Sending Their Children to Camp:

1. Choose the camp best suited to the needs of your child. Use the Internet, other parents, and local social service centers as resources. Other resources are the American Camping Association, 5000 State Rd. 67 N., Martinsville, IN 46151; phone: (800) 428-2267; fax: (317) 342-2065; and the National Easter Seal Society, 230 W. Monroe, Chicago, IL 60606; phone: (800) 6827; TTY: (312) 726-4258.
2. Visit the camp of your choice, exercise your right to ask any and all questions, and make sure you feel good about the environment, the program, and staff before deciding to send your child.
3. If you need to, call the camp each day. You can make arrangements for the camp to call you if there are problems.
4. Take your child's "resume" along with the highlights of his/her likes and dislikes, behaviors, interests, idiosyncrasies, needs, etc. (Counselors tell us they really appreciate this)!
5. Remind yourself that the first year is the hardest.
6. Use your imagination and visualization as an aid: whenever you wonder or begin to worry about your child, visualize him or her having the time of his/her life at camp. Do not visualize negative images.
7. Look at this time away from your child as an opportunity to redefine yourself apart from your child.
8. Make a list of things to do (work and/or play) while your child is away that his/her care prevents you from otherwise doing.
9. Take at least one nap a day.
10. Remind yourself that you earned this freedom, again and again if necessary.
11. Savor the anticipation of reunion with your child.

vulnerability.

Armed with a "resume" detailing everything you would ever want to know about Darwin if you were his camp counselor, we resolved to give camp a try that first year. We consoled ourselves with the fact that the camp was located only 88 minutes and 45 seconds away from home, just in case it did not work out. And we had the assurance of the camp director that she would not hesitate to call if there was trouble.

We drove away with image of Darwin bouncing a ball, seemingly oblivious to our leaving (and grieving). I felt a huge lump begin to swell in the back of my throat.

The phone call came minutes after we arrived home to a much-too-quiet house. Darwin's "evil twin brother" had already made an appearance, accompanied by some unexpected hitting and pinching. With some careful behavior management coaching over the telephone, my husband was able to offer suggestions that worked until Darwin settled into the new camp routine.

Darwin's experience

Although the "evil twin brother" made an early appearance at camp, Darwin soon adjusted and seemed to enjoy his stay, according to his counselors. It was not surprising to hear that he did not sleep well, but he amazed his cabin counselors with his ability to swim and liked the dance parties at night. After five days of Darwin duty, they did not look too worn out when we arrived, and it was obvious they had bonded with him.

Perhaps Darwin thought we had abandoned him. For when we arrived to take him home and showered him with tears and hugs, he tolerated the enthusiastic display of affection for a few seconds and then stepped back to examine us thoughtfully. He was NOT happy that we had almost abandoned him.

Transitions like these are especially tough for our kids. Darwin was not the only camper "unloading" on his parents. Once Darwin finished his brief outburst, however, he calmly took us by the hand and headed for the car.

Mom's experience

As we left Darwin at camp the first summer and headed home, I was enveloped by an overwhelming sense of loss. My husband and I both arranged to take the week off from our respective jobs and had a lengthy list of

Exceptional children deserve exceptional care.

The best help for cerebral palsy, spina bifida and related disorders is at Kennedy Krieger Institute.

For 61 years, Kennedy Krieger Institute has been the leader in helping children with severe disabilities. Focusing on early identification, intervention and treatment, our state-of-the-art interdisciplinary team approach—combined with a caring, supportive touch—has enabled generations of children to live their lives to the fullest.

Our comprehensive assessment and treatment for children with cerebral palsy, spina bifida and related disorders includes: Neurology, Medical Services, Nursing, Urology, Orthopedics, Physical Therapy, Occupational Therapy, Orthotist, Clinical Psychology, Neuro-Psychology, Seating, Feeding, as well as Rhizotomy, Spasticity and Movement Disorder clinics.

And unlike many programs, we see patients beyond age 18. Call Kennedy Krieger Institute today. We're here to help.

AS A YOUNG ADULT, HE NEEDS TO BREAK AWAY FROM US AND SOCIALIZE MORE WITH HIS PEERS. HE NEEDS THIS OPPORTUNITY FOR INDEPENDENCE AND GROWTH (AS WE DO).

house projects to tackle, all of them virtually impossible to do with Darwin under foot. I knew I needed to keep busy. I carefully hid all his toys in the closet and avoided anything that remind me of him.

I cried a lot, especially the first day. As much as I knew I needed this freedom, I was not sure I could survive the five days ahead. My youngest son, then 11, wanted to know if I would cry as much if he decided to go to camp. Although sibling rivalry is not a big issue in our house, he needed the reassurance that he would be equally missed.

As the week progressed, I cried less and began to adjust to my newfound freedom. It began to dawn on me that for the first time in 15 years, I could spend each precious day as I wanted!

Reflections

During the past three years, I have come to realize that Darwin needs these five days away from us as much as we need this time of freedom. Although we hire respite care providers (when we can find brave ones willing to work with an incontinent 17-year-old with challenging behaviors). Darwin has no real friends, other than his loving family. As a young adult, he needs to break away from us and socialize more with his peers. He needs this opportunity for independence and growth (as we do).

As Darwin has gradually become better adjusted to the camp routine each summer, so have I. It is my opportunity to redefine my roles of wife and mother and spend more time with the other two men, my husband and other son, in my life. It is my opportunity to let go of my son—just a little. **EP**

Annandale Village: *Their Community... With Our Help!*

Our Mission:

...to perpetuate a private, nonprofit Village community offering adults with developmental disabilities an improved quality of life. The Village provides professionally managed and cost effective lifestyle alternatives through specialized programs and services flexible enough to meet individual needs. These programs are a significant part of our original goal of offering a balance of freedom, encouragement and instruction that help each Villager achieve his or her own level of independence and fulfillment.

Our Programs:

- Paid Vocational Training and Job Placement
- Creative and Performing Arts
- Recreational and LeisureActivities with Skills Training for Special Olympics
- Daily Living / Life Skills

A JOURNEY OUT OF DARKNESS

A mother's recollections of caring for her daughter with multiple disabilities

by Mary Ann Veade

Clockwise from left: Elizabeth proudly shows off her completed homework; Elizabeth in her incubator as a newborn; and riding her bike near her home.

The wheels of the school bus can be heard as it makes its way down our street. "Hurry," I sign to my curly blonde-haired, blue-eyed little girl as she boards the bright yellow school bus. A kiss on the cheek and the sign of "I love you" start another day. As I turn to walk back to the house, I wipe away a tear that has managed to cloud my vision. It is partially a tear of sadness for my selfishness of wanting to keep her all to myself, but mostly of happiness in seeing this child, our child, walk away so proudly and independently.

For most first-grade children, boarding a school bus seems quite an easy task. However, for Elizabeth, who struggled at birth to live and who, according to doctors, would never have use of her arms or legs, this is quite an accomplishment. And yes, as you might have guessed by now, she is also deaf. I close the door softly behind me. I take out my journal that I have kept since her birth and take a step back in time.

The day October 31, 1991, will always remain a very special one in our lives, for it was on this day that our little Elizabeth was born. Born just two weeks early and weighing a mere four and one half pounds, our daughter came into this world fighting for her life. My husband and I were told that our baby girl would probably have brain damage and would most likely have less than a year to live. The manner in which we were given the diagnosis was so cold and unfeeling. The doctors seemed not to care as they rattled off the grim prognosis for our daughter. Other potential challenges such as deafness were also discussed. Her deformed feet led them to believe that she would also be crippled.

I remember trying to place myself somewhere else, for if I could be somewhere else this horrible experience would not be happening. I did not want to hear what was being told to us. I did not know which way to turn, and the lump in my throat would not go away. The tightness in my chest persisted and my feelings of desperation and helplessness increased. Questions bombarded my mind every day. Why did I feel all alone? What could I do to help? Why did this happen to us? What did I do wrong? Was I being punished? Did I do something during my pregnancy to hurt this little helpless infant?

We were able to take Elizabeth home when she was twelve days old. While playing with her one day, I clapped two shoes together in front of her face only to receive a blank stare from the infant looking back at me. Deep down inside I knew this was not a normal response. On January 23, 1992, our lives were changed forever, for it was on this day one of my worst fears was confirmed.

I held my tiny three-month-old daughter Elizabeth in my arms as the audiologist placed the electrodes on her scalp. Each time a sound was emitted from the machine, I watched anxiously to see if Elizabeth would respond. Each time a quick glance at the audiologist's face revealed the horrible truth I did not

Above: the Veade family—(from left to right) daughter [illegible] 12, son, Thomas, 17, Mary Ann (mom), Elizabeth, 8, Webster (dad), and [illegible] Christine, 15. Left: Elizabeth's graduation day from Bright School [illegible] 6.

want to face. My fears became a reality. Our three-month-old baby girl was living in a world of silence. I felt numb as my husband and I sat there trying to absorb the news just revealed to us. I felt as if a ton of bricks had been dropped on my chest, and a tremendous feeling of helplessness enveloped me. We watched two video tapes about different modes of communication to use with deaf children. As I sat there watching, nothing seemed to sink in. The word "deaf" got stuck in my throat every time I tried to utter it. The tapes ended and we were given advice about getting Elizabeth started in an early-intervention program.

The drive home was a solemn one. Finally we arrived. I remember feeling like not doing much of anything. It was as if life had stopped. I did not care what I looked like and did not care to go anywhere or do anything. The dreadful hours lapsed into days, the days into weeks. I often thought about the woman who showed us the video tapes and encouraged my husband and I to call the principal at Bright School in New Orleans to inquire about an early-intervention program for Elizabeth. Several times I wanted to pick up the phone, but my hand would not, could not, reach for it. I was numb, frozen in a state of helpless despair, and I could not break free.

Finally one day the phone rang. It was the same lady from the hearing center asking if I had called the principal. When I told her I had not, she offered to call on my behalf. I agreed, knowing that I had to move on if I were to be of any help to Elizabeth and our other three children. Two days later the principal called, and we were now on the road to finding help for Elizabeth.

A whole new world

Elizabeth was enrolled into Bright School in New Orleans at the age of three and a half months. It was here that she received the foundations upon which she would build her language. While going to school, there were many days that were missed due to operations on her hands and feet. The days were often intertwined with visits to doctors, not to mention the numerous therapy sessions that ensued. Fortunately, each therapy session as well as each operation proved to be an improvement to Elizabeth's health and well-being.

The day is Tuesday, April 22, 1996. The place is the hearing center. The room—the same room where it all began. This time my husband and I are here to talk about cochlear implants. Again, questions bombarded my mind. Is this the right decision? Will a cochlear implant help our daughter's hearing? Will she be angry with us? Are there risks involved? What if it does not work?

This was one of our most difficult decisions since Elizabeth's birth. Other decisions we had made, such as agreeing to an operation that would enable our child to walk, were much easier. We knew that this decision would mean a lot of work on our part and on hers. We also knew that it would mean years of speech therapy and tons of patience. On June 16, 1996, after much prayer and deliberation, Elizabeth received her cochlear implant.

With eager anticipation, we waited. Was the surgery a succes[illegible] she actually be able to hear m[illegible] and other sounds?

One day, my answer [illegible] was working with her at the kitchen table. The sound I always abhorred, the dryer buzzer, caused Elizabeth to jump up and hand me the phone. With anxiety in my voice, I said and signed to her, "Did you hear that?" When she signed "yes" back to me, I knew that a whole new world was about to unfold for her. Years later, I would be proven right when she spoke a full sentence to me in the hospital. She was recovering from one of her operations and called out to me in the middle of the night, "Mother, mother, want more ice." This is the stuff that faith and dreams are made of.

Faith, family, and a simple phone call

Certainly a lot has taken place in Elizabeth's life so far. My feeling of desperation is slowly dwindling away. I know it will never be gone forever, for a little part of me will always remember the tightness in my chest and inability to breathe upon receiving all of the information the first few days of Elizabeth's life. The grim look on everyone's faces will be burned in my mind forever, as will the feeling of helplessness when I heard that

Elizabeth was deaf. She might not ever enjoy one of my bedtime songs or perhaps never hear the sincerity of my voice when I tell her "I love you." No, these things are certainly not easy to accept or forget, but at the same time I can now look with hope to the future.

When I reflect on my experiences of taking care of Elizabeth, I am drawn to thoughts on how I made it through some very difficult years. First and foremost, there was my family, especially my husband, Webster. I remember how he—and our parents—stuck by my side constantly in the hospital, as I was too devastated by my daughter's prognosis to think straight. My faith in God and the sisters and pastor who prayed with and for us helped a great deal as well. Then there were my friends, the family counselor at Bright School, and the person who encouraged me to write a journal. Thank goodness I had such a strong support system. Thank goodness I had the encouragement to work past the guilt and anger and concentrate on helping my daughter.

Finally, I must mention the importance of that very first call from the concerned woman at the hearing center. That simple phone call marked the beginning of the end of my acute state of denial and helplessness. She urged me to make inquiries, ask questions, and seek out advice. She—and others—reached out to me, letting me know that we were not alone, and that made all the difference in the world.

It is September 16, 1999. I hear a familiar sound of wheels turning. I see the color of bright yellow peeking between the trees. The screech of the brakes tells me my special someone has arrived.

Proudly, backpack stretched over her shoulders, she exits the bus. A little tired from the day's activities, she manages one of her irresistible smiles. We walk into the house. After a snack, she is ready as always to begin her homework.

She writes her name across the top of the page. "Elizabeth". I contemplate for a moment and remember the meaning of the word "Elizabeth": Gift from God. She truly is our gift from God.

I close my journal. Tomorrow begins another day. **EP**

EXTRAORDINARY PARENTING

THE POWER OF ATTITUDE in Reaching Children with Special Needs

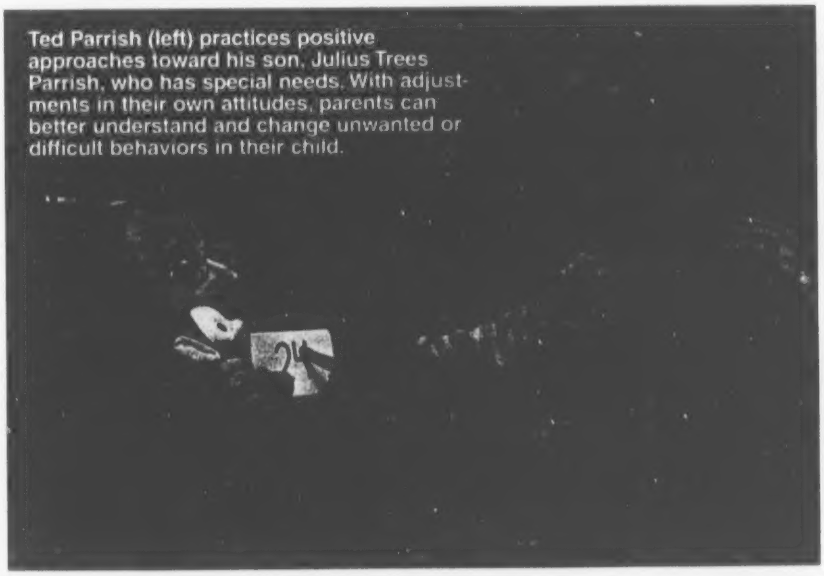
by Steven R. Wertz, MA, with Kaitryn Wertz

Attitudes, thoughts, and feelings are important when we parent a child, and have a greater impact on our effectiveness than techniques or strategies. Parents who examine and change their own thoughts and feelings become more effective in virtually every circumstance. By understanding the role of our attitudes, we become less likely to reinforce and teach unwanted behaviors in our children. We also become more capable of inspiring our children to develop self-confidence, the desire to learn, and the strength to overcome difficulties.

This principle is especially important in extreme situations. I have worked with parents whose children break glass, throw food, smear feces, bite, kick and spit. Why do children do these things?

I have found, from my experience working with parents and teachers, that the most powerful and effective approach with children who have special needs is a marriage of mind and heart, science and attitude. We can meet the challenge by strengthening both. Consider Kevin, 12, who has autism, and his father, Joe. Joe was very concerned about Kevin's aggressive behavior. Kevin often hit, kicked, scratched, or bit people. The only way Joe could stop him was to restrain him, or, if all else failed, hit him. But Kevin's aggression was escalating, and Joe was at his wit's end.

When Joe and I later discussed his reactions, Joe revealed his fear that Kevin's behavior was a reflection of poor parenting. He felt inadequate to handle Kevin. As he explored his feelings, he began to change his outlook. He decided that Kevin's behavior was not a reflection of bad parenting, but an indication that "normal" parenting was occurring where extraordinary parenting was necessary. Joe realized that he could use Kevin's outbursts as opportunities to find the extraordinary within himself. Instead of focusing on how to stop Kevin, Joe now wanted to help Kevin learn to interact gently.



Ted Parrish (left) practices positive approaches toward his son, Julius Trees Parrish, who has special needs. With adjustments in their own attitudes, parents can better understand and change unwanted or difficult behaviors in their child.

The next session was very different. When Kevin kicked Joe, Joe said softly, "Kevin, no matter what you do, I'm never going to hit you again." Kevin grew more agitated and tried to kick his dad again. Joe moved out of the way and repeated his statement. Kevin started to cry. He said, "I'm supposed to kick you and you're supposed to hit me. That's how we do it."

For Kevin, the violent interaction was a ritual. It was consistent and predictable, and it provided him with attention. Joe had unintentionally reinforced Kevin's behavior with his angry reactions.

Attitudinal training helps parents become comfortable with the challenging behaviors of their children. When parents change their feelings about such behaviors, both the frequency and intensity of the incidents diminishes.

As was the case with Joe and Kevin, when we are uncomfortable, we are likely to react in ways that reinforce

Difficult behavior in their child is a challenge for parents. By changing their own attitudes and approaches, parents can help improve the situation.

Child's Behavior	Parent's Attitude	Parent's Approach
Pinching, hitting, hair pulling, etc.	No discomfort with the behavior. Accept that your child is doing what he or she can to interact.	1)Take care of yourself—get out of the line of fire. 2) Do not react to or reinforce the behavior. 3) React more dramatically to gentleness and affection.
Whining, crying and apparent distress.	Trust in your child's ability to handle what is happening. Do not pity. Feel strong and peaceful and your child will pick up on that.	Be present and helpful without rewarding their distress, as this "teaches" unhappiness. Reward emotional strength and clarity.
Yelling "NO!" and refusing to do something (like bathe).	No reaction of frustration. Understanding your child's desire for control.	Show your child that yelling does not push your buttons or get you to back off from your request. Persist with the bath, and offer control of what toy is brought to the bath, the water temperature, etc.
Not eating certain healthy food (like broccoli).	Create in yourself a love of broccoli that surpasses your love of ice cream (at least temporarily).	Model—eat the food and express your delight in it. Get other family members to participate. React with delight when your child takes a taste.
Not participating in curriculum, therapies, etc.	Foster within yourself an uncommon delight in the material or in the therapy.	Demonstrate your love of the material. Show your child how it will benefit them. Show how doing it is fun.
Fear of failure, not wanting to make mistakes.	Have no fear of failure— your own or your child's. Enjoy mistakes. They are the stuff that learning is made of.	Cheer all answers first. If you ask what is 2+2 and your child says 5, celebrate. Then "check" and discover that it is four. Accept your own mistakes in your child's presence.
Emotional upset around certain specific events (like being called names by other children).	These events are not to be avoided. They are cherished opportunities to parent. Help your child learn to digest them.	Recreate the troubling event, giving strategies for coping, and a framework for understanding.

the very behavior we do not want. When we become comfortable with the same behavior, we are able to shape our responses in order to elicit the behavior we want.

We can also use attitude as a powerful educational tool. When encouraging the development of new skills, our primary job is not to focus on a particular subject, but to teach a love of that subject or skill. For example, 3-year-old Sarah babbled, but she never imitated sounds or spoke words. Sarah had one great love in her life: Cheerios. In this particular instance, she sat on a stool with a bowl of Cheerios on a nearby shelf. She was babbling and disen-

continued on page 64

continued from page 63

gaged. In the middle of random sounds, she made a noise vaguely like "O". Her teacher said, "O's?" He jumped theatrically, ran, grabbed Cheerio's, and thrust them into Sarah's hand—repeatedly saying, "O's!"

Sarah looked at the cereal and softly said, "O." She laughed, beginning a game in which she periodically called out "O's" and the teacher raced for the cereal. Her typical blank expression was replaced with a huge grin. Sarah was not just making a sound. She was delighting in the power of sound.

Behaviorism focuses on behavior, without emphasizing the importance of the teacher's feelings and attitude. If we focused on behavior rather than attitude, the reinforcer would have been Cheerios. But it wasn't. Often, Sarah did not even eat the Cheerios. The main event and reinforcer for Sarah was the pleasure of using sound to move a person. The key words are pleasure and person. When I train parents, the primary intention is to create pleasure in the activity, and to draw the child into that enjoyment.

This does not mean success is inevitable if our hearts are in the right place. Technical skill and scientific teaching strategies, without focus on attitudes, tend to produce children who are robotic and less emotionally alive. An attitudinal approach, without educational strategy and assessment, results in happier, more interactive children; however, their learning often plateaus without scientific assessment and educational methods.

We strengthen our hearts by recognizing and changing counter-productive attitudes, and by engendering the delight that awakens motivation in children. We strengthen our minds by learning the techniques and principles that research has substantiated. Combining these, we become extraordinary parents and educators who can help our children become more complete, more powerful and more able to achieve their potential. **EP**

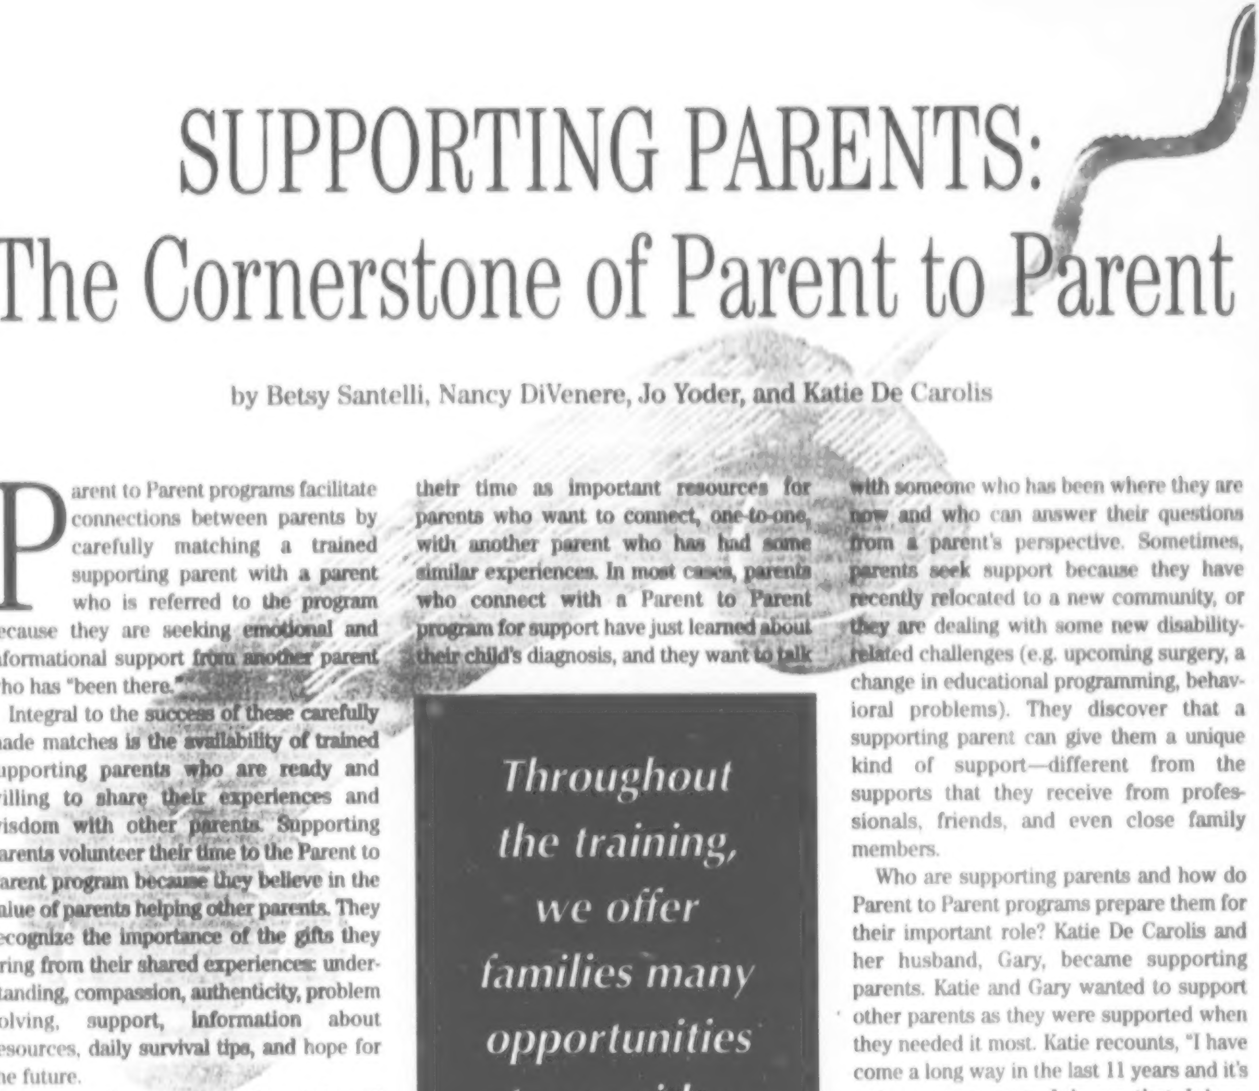
SUPPORTING PARENTS: The Cornerstone of Parent to Parent



by Betsy Santelli, Nancy DiVenere, Jo Yoder, and Katie De Carolis

Parent to Parent programs facilitate connections between parents by carefully matching a trained supporting parent with a parent who is referred to the program because they are seeking emotional and informational support from another parent who has "been there."

Integral to the success of these carefully made matches is the availability of trained supporting parents who are ready and willing to share their experiences and wisdom with other parents. Supporting parents volunteer their time to the Parent to Parent program because they believe in the value of parents helping other parents. They recognize the importance of the gifts they bring from their shared experiences: understanding, compassion, authenticity, problem solving, support, information about resources, daily survival tips, and hope for the future.

These and countless other informal supports provided by parents through the one-to-one parent match are wonderful complements to the services that children with special needs and their families receive from the formal service system. As Katie De Carolis—a parent who connected with Parent to Parent of Vermont first as a referred parent and then as a supporting parent—comments: "Shortly after our daughter Emily was diagnosed with Down syndrome and we were feeling consumed by disability information, my supporting parent helped me to see beyond the disability by bringing me a book about parenting. Just parenting—not parenting your child with a disability—but just parenting. That simple gesture helped me to remember that I was still a mom with a new baby. A horrendous cloud started to lift at that very moment."

There are over 40,000 trained supporting parents nationwide who are volunteering their time as important resources for parents who want to connect, one-to-one, with another parent who has had some similar experiences. In most cases, parents who connect with a Parent to Parent program for support have just learned about their child's diagnosis, and they want to talk with someone who has been where they are now and who can answer their questions from a parent's perspective. Sometimes, parents seek support because they have recently relocated to a new community, or they are dealing with some new disability-related challenges (e.g. upcoming surgery, a change in educational programming, behavioral problems). They discover that a supporting parent can give them a unique kind of support—different from the supports that they receive from professionals, friends, and even close family members.

> *Throughout the training, we offer families many opportunities to consider their own experiences as parents and how they can use these experiences as they support other parents.*

Who are supporting parents and how do Parent to Parent programs prepare them for their important role? Katie De Carolis and her husband, Gary, became supporting parents. Katie and Gary wanted to support other parents as they were supported when they needed it most. Katie recounts, "I have come a long way in the last 11 years and it's not as scary now. I know that I have something to give." Other parents choose to become supporting parents because they did not connect with another parent until months or years after their child was diagnosed, and they want to ensure that other parents do not have to go it alone.

In either case, supporting parents bring years of experience to the match, and the training that they receive before they are matched builds upon their strengths. Nancy DiVenere, director of Parent to Parent of Vermont, explains, "Our supporting parent training helps ensure the success of the one-to-one matches that are the cornerstone of Parent to Parent of Vermont. Throughout the training, we offer families many opportunities to consider their own experiences as parents and how they can use these experiences as they support other parents. The training also gives them some specific

tools for careful listening and for communicating with referred parents in ways that make it easy and comfortable for conversations to continue.

The training that Parent to Parent of Vermont provides to supporting parents is typical of that offered by Parent to Parent programs nationally. The results of the national survey of Parent to Parent programs conducted by the Beach Center on Families and Disability indicate that 78 percent of Parent to Parent programs offer at least 4 hours of training (with 44 percent providing more than 10 hours of training) before parents are matched as supporting parents, and in over 80 percent of Parent to Parent programs, the content of the training includes: listening and communication skills, an orientation to Parent to Parent, understanding the emotional adjustment to the diagnosis, and information about disabilities and community resources. Other content areas that are included in the training offered by over half of Parent to Parent programs include: positive philosophy about disability, self-awareness activities, knowing when and how to refer, and advocacy training. Most programs have training manuals available as resources.

In Parent to Parent of Vermont's training course, a facilitator invites parents to share their own family stories and the feelings they experienced when they learned of their child's diagnosis. This intimate sharing serves as a model for their parent matches, and it helps the supporting parents to reconnect with their strong emotional reactions to their child's special needs. A follow-up discussion of the common stages in the adjustment process (e.g. denial, anger, guilt, sorrow) uses the family stories to identify these responses and to emphasize that, while there are common emotional responses, no two parents will experience these feelings in exactly the same way. The facilitator points out that supporting parents are in a unique and credible position to first recognize where in the adjustment process a referred parent may be and then to reassure the referred parent that these feelings are familiar and normal.

Parents write down five things that they value most in life (e.g. family, freedom, self-respect, love) and share these with the large group. Then the parents are told that they must choose two of their values to keep and three to give up. The resulting tension is a great indicator of the importance of personal values, and of how uncomfortable it is to be told to them. The overall discussion that follows provides evidence that everyone has his or her own values, no one can choose values for another, and that values affect the decisions parents will need to make regarding their child with special needs.

> *...everyone has his or her own values, no one can choose values for another, and values affect the decisions parents will need to make regarding their child with special needs.*

All Parent to Parent programs include in their training information about, and time to practice, communication and listening skills. In some programs, facilitators introduce communication and listening skills by asking the parents to recall a conversation about their child that went really well and to consider what was happening in that conversation that led to its success. As parents volunteer they practice good communication skills (verbal or non-verbal communication strategies). It then becomes easy to see how body posture, eye contact, and facial expressions are non-verbal influences on a conversation.

Most Parent to Parent programs also include time for considering what the role of the supporting parent [illegible] to offer emotional support in encouraging ways, to provide information without [illegible], provide a safe environment for problem solving, be a friend) and is not. Often this discussion is based upon their own [illegible] about the support they received and [illegible] they found helpful and not so [illegible] about that support. Parents always [illegible] information about what to do when a referred parent needs more support than a supporting parent can provide, as well as what they can expect as their match gets under way. **EP**

If you are interested in learning more about the supporting parent training and available resources from Parent to Parent of Vermont, please contact them at: One Main St, 69 Champlain Mill, Winooski, VT 05404; phone: (802) 655-5290; E-mail: p2pvt@together.net; Web site: http://www.partoparvt.org.

A *dynamic breakthrough in digitized speech.*

Battery
Memory
Hi!
Cool!
Thank You
Goodbye!
No way!
Excuse me

The new Dynamo Digitized Speech Device is simplicity itself. It breaks through the barriers of cost and complexity to give a whole new generation of users a chance to be heard. With its small, rugged case and a weight of just under 1.8 pounds, the new Dynamo Digitized Speech Device redefines digitized speech. The dynamic display eliminates the need for paper overlays. Scanning can be done with a single switch. Extra-long recording time allows more speech in any language. And communicators can enjoy greater independence through its infrared control.

The new Dynamo Digitized Speech Device is also a simple and economical diagnostic tool for cognitive abilities of children and seniors. Since it uses a similar menu system to DynaVox, the new Dynamo makes it easy to progress to other DynaVox communication solutions. And Dynamo is backed by DynaVox Systems, the world's leading provider of advanced augmentative communication solutions.

For more information on the new Dynamo Digitized Speech Device, call DynaVox Systems at **888-697-7332**.

Can We Talk?

PARENTS' PERSPECTIVES ON AUGMENTATIVE AND ALTERNATIVE COMMUNICATION

by Peggi McNairn, Ph.D., CCC/SLP, ATP
and
Cindy Shioleno, M.Ed.

For many children and their families, identifying and obtaining an augmentative/alternative communication (AAC) device is not a simple process. This was the case for Dr. Hal and Christi Urschel and their 4-year-old son, Chance, of Dallas, Texas. Born with holoprocencephaly (a congential defect caused by an extra chromosome), Chance is unable to walk or talk like other children his age. "It has taken almost a complete year to find what is probably the optimal assistive technology solution for our household," reflects Dr. Urschel.

With the realization that their children will require assistive technology, families often enter a world alien to them. This is a world filled with techno-jargon and foreign gadgets.

ASSISTIVE TECHNOLOGY

Before families can understand augmentative and alternative communication systems, they must first look at the big picture of what their children may need. For many parents, this journey begins with the understanding of what assistive technology is and what it can do for their children. One commonly accepted definition can be found in the Individuals with Disabilities Education Act (IDEA), the federal law which was revised in 1997.

According to IDEA, assistive technology is "any item, piece of equipment, or product system, whether acquired commercially off the shelf, modified, or customized, that is used to increase, maintain, or improve the functional capabilities of a child with a disability." Assistive technology can be as simple as a special grip on a pencil or as sophisticated as a high-powered computer system.

"Assistive technology, for us, means anything to help our daughter be more independent," says Laura Warburg of Louisville, Kentucky, mother of 9-year-old Candice. Candice, who has cerebral

Parents of children who use AAC share helpful information, stories, and insights about their experiences with the process of selecting and using communication systems.

palsy, has overcome many obstacles in her short lifetime. "As Candice gets older, she insists on doing things 'by herself!' She's reaching an age, at 9, where she doesn't want mom or dad around to help her all the time. She keeps us moving forward in our search for more and better ways of doing everything. She's still mastering some fine and gross motor capabilities. What didn't work yesterday, many times, will work today."

Assistive technology can be divided into six very broad categories: mobility, positioning, environmental control systems, personal care/leisure, computers (with and without adaptive devices), and augmentative and alternative communication (AAC).

According to the American Speech-Language-Hearing Association (ASHA) in Rockville, Maryland, augmentative and alternative communication "refers to all communication that supplements or augments speech." AAC covers a broad range of techniques and strategies, from simple picture boards to sophisticated, computer-based communication devices with synthetic voices. Other examples of augmentative and alternative communication may include facial expressions, gestures, body postures, eye-gaze, sign language, drawing, and writing.

The importance of communication became evident to the Warburgs when Candice began kindergarten. Laura Warburg recalls that her daughter "was starving for ways to communicate with her classmates, teachers and with even us, her family. Yes, we understood some of what she was able to verbalize to us at that point, but so many times she'd mutter, 'never mind,' and turn away from us after we didn't 'get it' the first few times." The family knew it was time to take action.

"So we began realizing that not only did she have more to say, but that she deserved to be heard!" says Laura. "It was our job to give her access to the tools to communicate with the people in her world—not just with her family and teachers, but with anyone she would meet. Today, she has a DynaVox™ (an electronic communication device) mounted to her wheelchair. She studies for spelling tests with it. She can tell jokes with it. She can use word prediction to compose her own thoughts or she can tell me, her 'programmer,' what she wants me to help her say with it. AAC reinforces her confidence by making her efforts to communicate more efficient."

AAC is most effective when thought of as a "system" for communication rather than as one specific device, piece of equipment, or technique. When taught a variety of communication techniques, a child has a better chance of being successful in communicating his or her thoughts in every situation. Using a "systems" approach avoids the many pitfalls of relying on only one device or technique. The Urschels believe that "the goal of augmentative communication is to allow children to communicate with family members as well as non-family members in all areas of their lives, so that they can share in the richness of multiple intercommunications without having to settle for only being able to communicate part of their thoughts."

EARLY INTERVENTION

Knowing when to use augmentative and alternative communication is almost as complex as understanding what it is. For

Speech/Language Pathologist	Information on language and communication skills, ongoing implementation and development of system
Teacher	Identification and implementation of curriculum and classroom communication needs
Vision Specialist	Information on visual acuity, skills, and needs
Vocational Counselor/ Transition Specialist	Vocational testing and counseling, funding information

continued from page 73

some children, AAC may be their primary means of communication. Others may use it to clarify and expand their speech. Regardless of why the child uses AAC, developing a communication system at an early age is imperative.

Accepting that a child needs an augmentative communication device may be difficult for some families for many different reasons. This was true for the Warburg family. "I've heard many parents and teaching professionals voice their fear about AAC inhibiting speech development. Personally, that was never one of our excuses in the early days of our denial about AAC," says Laura Warburg. "Our denial stemmed from being overwhelmed with all the physical aspects of cerebral palsy and Candice's lack of consistent ability to make a selection between two pictures. We wanted instant gratification. Her interest and her laughter served as the instant gratification we needed at the time. She has a belly laugh that is unbelievably contagious. It was a passive and contented existence for a while. Looking back on these early days, I think it would have taken a knowledgeable AAC friend to 'camp out' with us in real life (as opposed to observing in therapy sessions) for more than just an hour a week to have convinced us of other needs and possibilities."

In reflecting on those early years, Laura believes, "It's never too soon to introduce AAC to a family. AAC introduction plants a seed. It may take a long time for it to take root or it may start to grow immediately. All families come with different dynamics. It's important for professionals to get an idea about daily life."

> **"It's never too soon to introduce AAC to a family. AAC introduction plants a seed."**

THE TEAM PROCESS

Because the selection, operation, and use of augmentative communication systems requires input from more than one discipline, the use of a "team approach" is essential. Although the concept of using a team to deliver AAC services is not a new one, the reauthorization of IDEA requires key decisions to be made by teams for school-aged children. This team, in which the parents play a vital role, is one of IDEA's greatest strengths—as well as one of its greatest challenges. Unfortunately, many families still do not have access to assistive technology teams. "We never had one," says Laura Warburg. "Still don't. It's more like creative existence—being in the right place at the right time and asking the

continued on page 78

BEST COPY AVAILABLE

continued from page 77

right questions of the right people."

Augmentative communication teams may function in either a multidisciplinary, transdisciplinary, or interdisciplinary capacity. According to ASHA, these three basic types of teams differ in how team members interact one another and in how services are delivered.

Within a multidisciplinary team format, different specialists from several areas of expertise provide services in isolation from each other, evaluating and implementing results and recommendations independently within their respective areas. The results of this type of team format can be fragmented and misleading.

> **Core team members would ... interact frequently with the child in multiple environments such as school, home, and the community.**

With a transdisciplinary team format, one professional on the team assumes primary responsibility for direct services, while still consulting with professionals from other disciplines. This type of team format encourages professionals to cross traditional disciplinary boundaries and acquire knowledge of related disciplines that is then incorporated into their assessments and services. The disadvantage to this model is that children who require augmentative and alternative communication often have complicated and multifaceted needs. These children often require a higher level of expertise than any one professional can provide.

The third team approach, interdisciplinary, is typically composed of individuals who possess expertise in widely divergent areas. Unlike the multidisciplinary or transdisciplinary teams, a formal mechanism exists so that information is shared among the team members, and decisions are based upon this shared information. With this team approach, it is acknowledged that no one person or professional has adequate training or expertise in all of the necessary areas. As a result, team members, including the child and family, are involved with the entire process, sharing joint ownership, responsibilities, and outcomes.

TEAM MEMBERS

Identifying who should serve as a team member is one the first steps in building an effective AAC team. Deciding who should serve on the AAC team is dependent on many factors, including the needs of the child, the location of the team (hospital-, community-, agency-, or school-based), the type of information needed, and the supports that are required. Team members may include: parents, administrators, therapists, teachers, medical personnel, and AAC manufacturers. Table 1 lists a few of the possible team members and their roles and responsibilities.

While this list of potential team members may seem overwhelming, not all decisions must be made by the entire team. Including all potential team members in every decision may create a team so large that it has difficulty functioning. One strategy to control team size is to establish a core AAC team. Core team members would then interact frequently with the child in multiple environments such as school, home, and the community. Subgroups would be established and used on an "as needed" basis. The Urschels reported that, in addition to their regular therapists, "working with consultants in the speech, language, and assistive technology areas was extremely helpful." It is important that the team stay focused and committed to the common goal of assisting the child to become a successful communicator.

The level of expertise or skill that each member brings to the team may vary greatly. No one person can be expected to know or possess all the skills necessary for every AAC consumer. Many times, team members learn or acquire important skills during the assessment and implementation process. Other times, AAC consultants from other agencies may work with team members to complete the assessment and implementation process. Regardless of ability level, the key to success is for all team members to be aware of resources available and how to access those resources when needed. **EP**

The authors welcome questions and comments.

Peggi McNairn, PhD, CCC/SLP, ATP, is in private practice and serves as Texas Woman's University's Distance Learning Coordinator at the Education Service Center in Ft. Worth, Texas. She can be contacted at Quick Tech I.D.E.A.S.S., 215 Spanish Moss, Arlington, TX 76018-1540; telephone: (817)450-9561; E-mail: pmcnairn@aol.com.

Cindy Shioleno, M.Ed., is the Assistive Technology Specialist at the Education Service Center in Ft. Worth, TX. She can be contacted at Education Service Center Region XI, 3001 North Freeway, Ft. Worth, TX 76106; telephone (817)740-7594; E-mail: cshioleno@esc11.net.

ABOUT THE PARENTS:

Dr. Hal and Christi Urschel live in Dallas, TX, with their 4-year-old son, Chance.

Frank and Laura Warburg live in Louisville, KY, with their 9-year-old daughter, Candice, and 6-year-old son, Joey.

THE NATIONAL PERINATAL ASSOCIATION

Perinatal means "surrounding the time of birth" —a great time to be healthy!

The National Perinatal Association (NPA) is an association comprised of individuals and organizations concerned with perinatal health issues, from preconception through infancy, within a multicultural perspective. Their mission is to work toward the common goal of better healthcare for mothers and infants through education, research, and advocacy. The NPA relies on its members—healthcare consumers and professionals from across the spectrum of disciplines—to work together and help carry out its mission.

NATIONAL
PERINATAL
ASSOCIATION
NPA

One of their goals is to help construct a framework for national advocacy, and, by getting many different disciplines involved, create a greater understanding and a greater impact.

What Membership in the NPA Offers Parents

The NPA remains committed to the active inclusion of parents in all health decisions made about their children. According to NPA's Executive Director, Sheila S. Sorkin, "Parents and infants are the centerpoint of all perinatal care concerns." Ms. Sorkin says that parents may benefit from participation in the NPA's Annual Clinical Conference, where they can learn about products and services available, as well as information sessions, which include "Models of Care."

The NPA also considers individuals (family members) eligible for their annual awards program. Recently, the NPA recognized Julie Gordon, the mother of a child with special needs and founder of MUMS (Mothers United for Moral Support, Inc.), now a national support organization for parents or care providers of children with birth defects, chromosomal abnormalities, or rare medical conditions.

In addition, parents are invited to contribute to the NPA bulletin, serve as members of the various NPA committees and ultimately, sit on the Board of Directors. All NPA members receive a quarterly bulletin, which features articles on clinical care and research, advocacy, community service and maternal child health career development. Reduced-rate subscriptions to relevant magazines are another membership benefit.

Ms. Sorkin reports, "As a multidisciplinary association, the NPA has always included consumers in its programs and services. There is a renewed effort in outreach, which has been accomplished through the establishment of networks." She points out that the NPA's role as a sponsor and member of the planning committee for the upcoming World Congress and Exposition on Disabilities (see *Editor's Desk* for more information) will allow the group to have access to an even wider audience. "Through this effort, NPA has been introduced to other organizations whose mission is to serve caregivers. Families involved in perinatal issues often become caregivers. It is a wonderful opportunity for NPA to improve communication with such organizations."

Ideas into practice

Currently, the NPA is involved in numerous projects such as:

- Production of a monograph entitled "Transcultural Aspects of Perinatal Health Care" is under way. This monograph is for maternal and child health practitioners, educators, and perinatal specialists to help them care for mothers and their families in a way that is more sensitive to cultural background.
- "Models of Care" is a publication produced by the NPA for community, health, and service organizations.
- In 1999, the NPA organized a Summit Conference, a collaborative effort by 21 national maternal and child health organizations. Out of the conference proceedings came a monograph entitled, "Shaping the Future of Perinatal Health Care."
- NPA's Annual Clinical Conference provides education and networking for physicians, registered nurses, social workers, certified-nurse midwives, nurse practitioners, dietitians, educators, consumers, public health and health services workers, administrators, and multidisciplinary perinatal professionals.
- NPA leaders serve on the "Friendly Access" National Advisory Board. Friendly Access is a program providing quality perinatal care for low-income mothers run by the Lawton and Rhea Chiles Center for Healthy Infants, Mothers, and Babies. **EP**

FAMILIAR FACES

Hannah Danielle Moon, 3, loves to help out in the kitchen! Hannah, who has cerebral palsy, attends preschool three days a week. She loves her teacher and friends there. Some of her favorite activities are swimming, telling ghost stories, and helping her Mom cook. Hannah lives with her parents, Wayne and Kellie, in Oxford, AL. Hannah is looking forward to becoming a big sister on Valentine's Day.

Say Cheeseburger! **Wendell Fletcher Wood**, 4½, has CHARGE association, a rare genetic disorder. Wendell was born with a defect of the left eye, profound deafness, ear abnormalities, facial palsy, repaired heart defects, genital hypoplasia, and vocal cord paralysis, and needed a feeding tube. He has received Electronic Stimulator Therapy. Wendell has since had his tube removed, and a week later enjoyed his first burger and fries. Wendell loves Scooby-Doo and playing with his siblings. He lives on a farm in Clarence, MO with his parents Wendi and Lee, sister, Gretchen, 6½, and brother, Riley, 3.

Joshua (Joshy) William Kahrmann, 8, is all smiles! Joshy was diagnosed with Leigh disease. He attends Beaver Acres Elementary School, where he enjoys listening to stories, walking in a gait trainer, and scooting around in his adaptive chair. Joshy also loves upbeat music, like Disney songs. Joshy lives in Aloha, OR, with his Mom, Traci, Dad, Bill, and little brother, Michael, 3.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of *Exceptional Parent*? Send it to: Readers' Photos, *Exceptional Parent*, 555 Kinderkamack Road, Oradell, NJ 07649-1517. (Please do not send originals or "one-of-a-kinds" as we regret that photos cannot be returned.)

Two smiles are brighter than one! Twins, **Caanan and Jordan Williams**, 8, pose for a portrait with their stepmother, **Octavia Paul**. Caanan and Jordan were born premature, and both have cerebral palsy, shunts, mental retardation, and hydrocephalus. Caanan, who has seizures but is mobile, loves to dance and listen to music. Jordan has limited mobility and uses a wheelchair and loves to watch sports on TV. The twins attend public school and love to play together. They live in Dallas, TX with their Dad, Patrick Glenn and stepmother.

Benjamin Richard Lallak, 2, who has spastic quadriplegic cerebral palsy, has a smile that will melt your heart. He loves being outdoors, swinging on his swing set, and going for walks through the woods in his stroller with his Mom, Melissa, and Dad, Jeffrey. He has two cats, who walk right under his hands so he can pet them. Benjamin attends a daycare center with an aide. His family describes him as a determined and strong-willed little boy. Benjamin and his family live in International Falls, MN.

According to Grandpa William Cleghorn, his granddaughter **Savannah Lynne Cleghorn**, 6½, is "the joy of our lives." Savannah was born 3 months premature and was diagnosed with spastic quadriplegic cerebral palsy. She uses a wheelchair to get around and attends first grade. Savannah loves Saturday morning cartoons, computers, chicken nuggets, and camping with her brothers Mark, 9, and Joe, 11, her parents Victoria and Michael. She has weekly therapy and receives botox injections three times a year. She lives with her family in Las Vegas, NV.

On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

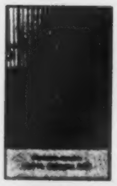
AUTISM

THROUGH THE EYES OF ALIENS
A Book About Autistic People **NEW!**
JASMINE LEE O'NEIL
This is a rich and positive description of how it feels to be autistic and how friends, family and the professionals that work with autistic people can be more sensitive to their needs. Written with a creative spin by an author who is autistic herself.
TF009AT **$24.95**

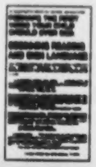
HANDBOOK OF AUTISM AND PERVASIVE DEVELOPMENTAL DISORDERS **NEW!**
Second Edition
DONALD COHEN AND FRED VOLKMAR
A comprehensive handbook that examines all forms of developmental disorders, with emphasis on autism. This second edition, now a two hands book, demonstrates and includes significant material and clinical studies that have been collected since the original text was published in 1987.
JW125AT **$99.95**



THE ULTIMATE STRANGER
The Autistic Child **NEW!**
CARL H. DELACATO
A new sensory approach to autism including an exciting breakthrough in treating an extremely difficult condition. Many suggestions are included for parents help them evaluate and to treat the problems of autism at home.
Autism
AT300AT **$15.00**

HEARING IMPAIRED

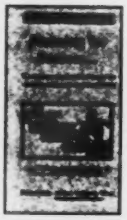
DEAF AND DISABLED OR DEAFNESS DISABLED? **NEW!**
MAIRIAN CORKER
Using a multidisciplinary, postmodernist approach in the search for an inclusive framework for understanding deafness and disability the text exposes the essentialism inherent in existing social, political and service frameworks which confuses issues of needs and rights and contribute to the creation and reinforcement of the power imbalances at the heart of disability oppression.
TT220HI **$25.95**



BEGINNING READING AND SIGN LANGUAGE **NEW!**
A video for those who wish to have their children learn sign. It is user friendly to both the hearing impaired and those who wish to learn sign as a form of communication with those who are hearing impaired.
AY300HI **$16.99**

HELEN KELLER PUBLIC SPEAKER
Sightless But Seen, Deaf But Heard
LOIS J. EINHORN **NEW!**
Helen Keller was an upliting orator who spoke from a unique vantage point for the cause of social imporvement. This is a collection and analysis of some of her finest speeches and presentations.
GP383HI **$55.00**

LEARNING DISABILITIES



PLANNING FOR SUCCESS **NEW!**
The College Application Process for Students With Learning Disabilities
The college admission process can be a confusing and overwhelming experience for students with learning disabilities and their families. This comprehensive video enables you to see the college application process from the very beginning. It shows early planning, college visits, the essays, and how to choose the best school for you.
LD201LD **$69.99**

THE EXPERTS SPEAK
Parenting the Child With Learning Disabilities
TERESA A. CITRO **NEW!**
A clear, comprehensive, and direct collection of writings by professionals in the field of learning disabilities in their area of concentration. Whether it is teaching, parenting, or socialization there are stories on it here.
LD200LD **$18.99**

INTERVENTIONS FOR STUDENTS WITH LEARNING DISABILITIES
A Meta-Analysis of Treatment Outcomes **NEW!**
H. LEE SWANSON WITH MAUREEN HOSKYN AND CAROLE LEE
A scientific study of different treatment methods used to improve the skills of learning disabled people.
GL050LD **$75.00**

FOR YOUNG PEOPLE

ON BEING SARAH **NEW!**
ELIZABETH HELFMAN
Sarah has the same wishes any girl has: meet people, make friends, see the world. An excellent story about a girl overcoming her disability, cerebral palsy, and the friends she makes along the way.
AW125CP **$13.95**

MOSES GOES TO A CONCERT
ISAAC MILLMAN
A story about a hearing impaired going to a concert for the first time and his experiences at this special event. The book is written in sign and english.
NEW!
HH105HI **$16.00**

I LIVE WITH DADDY
Judith Vigna
The tale of a girl who has parents who are divorced. She is forced to decide how to handle a day at school where both parents are supposed to come, but only her father arrives.
NEW!
AW130DI **$14.95**

EDUCATION

ACCOMMODATIONS IN HIGHER EDUCATION UNDER THE AMERICANS WITH DISABILITIES ACT (ADA)

MAKING TRACKS

by Jennifer Hester

Looking for a way to get your family outdoors this winter? You might try snowshoeing—an increasingly popular sport that is inexpensive, does not require a lot of specialized equipment, and can be done just about anywhere there is snow.

Snowshoes have been around even longer than skis. The first snowshoes were made of wood and leather, designed for trips or hauling things over the snow. Today's equipment is lighter and ideal for everything from casual walks or hikes, to overnight trips in the woods. "It's a great activity for families because it's inexpensive, and you can use snowshoes on just about any kind of terrain," says Billy Giblin, Nordic program coordinator for the National Sports Center for the Disabled in Colorado. "Try Nordic centers, golf courses, national, state and city parks, or downhill ski areas."

Anyone who can walk can snowshoe. The sport is a great choice for fun and fresh air and is accessible to people with many different disabilities.

Adaptive snowshoeing can be a low-cost adventure for the whole family

Going snowshoeing in parks requires only the cost of admission to the park, and access to most public lands, like national parks or forests, is free. If you want to try a groomed trail for your first snowshoe experience, try a Nordic center. Most centers charge a trail fee, which can range from $5 to $20.

Anyone who can walk can snowshoe, making it a great sport for children who have disabilities like visual and hearing impairments, amputations, brain injuries and developmental disabilities. If your child uses a wheelchair, try a close cousin to snowshoeing, cross-country sit-skiing. Manufacturers make cross-country sit-skis that use poles and arm power to propel the skier across the snow.

Nancy Brigham of Denver, Colorado, and her son, Colin, who has a developmental disability, have been avid snowshoers for several years. Nancy notes, "It's a nice way to get out into the snow without a lot of technique, especially if they have a problem with balance. It would be a good way of getting everybody with different levels out together."

TIPS for putting your best shoe forward

The first time you use your snowshoe equipment, try flat areas like roads. Then try deeper snow and hills. "Going up a hill, people may not be used to stepping in deep snow. Set your feet in. Plant your foot well and then move to the next step," says Giblin. "Make every step count."

When you are going uphill, do not bend too far forward. Stay upright on the snowshoes, to be sure they do not slip out from under you. "Initially walking downhill, keep your speed checked," says Giblin. "Stay on top of the snowshoes and just relax. Do not lean too far back, and keep your joints loose. If the hill is too steep for you, go in zig zags down the hill."

PHOTO BY KIEFEL SPORTFOLIO AND THE NATIONAL SPORTS CENTER FOR THE DISABLED

How to keep your snowshoe trip safe and comfortable:

- Layer your clothing. Snowshoeing is an aerobic exercise, and you will need to add and remove layers throughout your trip to keep comfortable. Remember, wet cotton does not insulate. Try wool or synthetic fabrics.
- Take breaks to drink fluids and eat snacks. You will be using lots of energy on your trip, and you need to stay hydrated even in cold weather.
- Protect your eyes from the sun. Glare off the snow can be damaging even on cloudy days, so wear sunglasses.
- Be sure someone knows where you are going and when you will be back.
- Be sure you are familiar with where you are going. Do you need to take a trail map?
- Take turns leading, especially in fresh snow. Breaking a trail can be tiring.
- Be aware of changing weather conditions, especially in the mountains.
- Take the time to learn about avalanche safety before your trip if you will be in avalanche country.

Easy outfitting

Snowshoeing has been called one of the hottest sports of recent years, probably because it is so easy to get started. There is no need for fancy clothes, expensive lessons, or difficult techniques.

Snowshoes typically have four parts: bindings, frames, decking, and claws. Bindings attach the snowshoe to your boot. Most bindings use a system similar to laces. Look for something that will be easy to work with in gloves or with cold hands. Frames are made of wood or metal and give the snowshoe its shape and size. Most modern snowshoes have lightweight aluminum frames. Decking is the material inside the frame that lets you "float" on the snow. Claws on the underside of the snowshoe give you traction on icy slopes. Most are at your toe and heel and are similar to crampons.

"A lot of manufacturers are making a good variety of small snowshoes for kids," says Giblin. "You can get a new pair of snowshoes for as low as $100, and most outdoor shops supply rentals. You can also look for used equipment in second-hand stores."

You can wear snowshoes with anything from sneakers to hiking boots. If your child wears cants in regular walking shoes, you can also cant the boots he or she will wear to the snowshoe. Poles are optional equipment for snowshoeing that can help children with balance problems. Some snowshoers use just one pole.

Snowshoeing is a great way to work the hamstrings, which can prevent knee and back injuries. It is also a good aerobic workout; snowshoes can get your family on the snow at a pace ranging from walking to running. The pendulum motion of your arms while snowshoeing makes it an upper-body exercise.

Snowshoeing is a confidence-building winter sport for many children. Because snowshoes have claws that grip the snow, children (and adults!) are less worried about slipping and falling than with sports like skiing. Brigham says Colin, 18, had been a skier for years. But as he got older, he grew more afraid of falling.

"He was getting so rigid on the slopes," she says. "I figured he needed to learn to move his body more. And as he got older, he was getting more afraid of falling. Plus, snowshoeing was cheaper. That's a nice thing about making it a family activity—it's economical. Plus you can do it anywhere." **EP**

Outdoor activities like snowshoeing are great opportunities for families to spend time together.

PHOTO BY KEEFEL SPORTFOLIO AND THE NATIONAL SPORTS CENTER FOR THE DISABLED

If your child uses a wheelchair, try a close cousin to snowshoeing, cross-country sit-skiing. Cross-country skiing is excellent aerobic exercise for both standing and sitting skiers.

CYSTIC FIBROSIS

What is it and what does it mean for your child?

By Preston W. Campbell III, M.D.

Take a deep breath. Hold it in. With your lungs filled, use a straw to breathe with the remaining space in your lungs. This is only the beginning of what it feels like to have severe lung disease, and cystic fibrosis (CF) is a prime example.

CF causes the body to produce abnormally thick and sticky mucus in the lungs and other organs. This mucus clogs the airways and provides a breeding ground for life-threatening lung infections. It can also block the duct from the pancreas to the small intestine, thus reducing or eliminating a person's ability to digest food. CF produces a number of symptoms such as very salty-tasting skin, recurrent pneumonia, failure to thrive, and chronic wheezing or coughing.

CF is a genetic disease inherited from *both* parents, just as one inherits hair color or eye color. In other words, for a person to have CF, he or she must inherit two defective copies of the CF gene—one from *each* parent. More than 10 million Americans are symptomless carriers of the defective CF gene.

There are approximately 30,000 individuals who have CF in the United States today. Currently, the median age of survival for a person who has CF is 32 years. New treatments and promising research, however, give us hope that many children born today who have CF may live into their 40s or 50s or beyond.

Q What does CF mean to my child?

A People who have CF have special healthcare needs including:

- special diets to ensure proper nutrition and growth;
- medications to counteract the effects of the disease, including replacement enzymes to help digest food; and
- chest physical therapy to help loosen and dislodge the thick and sticky mucus from the airways.

Most people who have CF can lead normal lives apart from these daily treatments. Most children who have CF grow up to attend school, have friends, and take part in regular sports and hobbies. Many adults who have CF marry and have families.

Parents of children who have CF should raise them with the same expectations and rules that they apply to other children. Having CF should not stop anyone from becoming a contributing member of society.

Q What can I do to make sure my child who has CF is in the best possible health?

A One of the most effective ways to make sure people who have CF are getting the best care is to encourage them to receive treatment at one of the more than 110 Cystic Fibrosis Foundation-accredited care centers across the United States. These centers provide specialized care using a multidisciplinary team approach. Teams of physicians, nurses, dietitians, and social workers are adept at recognizing and treating the unique healthcare needs of the person who has CF. This specialized medical care has been noted as one of the primary reasons why the median survival age for people who have CF has risen steadily for more than three decades.

Because CF affects the lungs, there are some other common-sense considerations that should be observed. People who have CF:

- should not smoke or be exposed to second-hand smoke;
- should have access to specialized CF healthcare;
- should strictly comply with the treatment regimen prescribed by their CF physician; and
- remain optimistic about new treatments and promising research.

Q What does a CF diagnosis mean financially?

A It is wise to learn as much as possible about managing medical expenses for CF care. Parents should comb through the details of their insurance plan and familiarize themselves with what is covered and what is not. The insurance policy should cover specialized medical care provided by CF specialists at CF Foundation-accredited care centers. Access to specialty care is critical for people who have CF and is a contributing factor in increasing both the quality and length of their lives.

There are also a number of state and local programs designed to help parents and adults deal with the expenses of diseases like CF. These

Ask the Doctor addresses issues of concern to our readers and is usually coordinated on a monthly basis by David Hirsch, M.D., a pediatrician and member of *Exceptional Parent's* Editorial Advisory Board. Dr. Hirsch is a partner in Phoenix Pediatrics, Ltd., in Phoenix, Arizona, and specializes in treating children who have developmental disabilities and chronic illnesses.

Parents should review any suggestions made in this column with the appropriate professionals. Mention of specific products or medications illustrate suggestions and are not endorsements of any specific products.

Send questions to: **Ask the Doctor**, *Exceptional Parent*, 555 Kinderkamack Road, Oradell, NJ 07649-1517, or fax, (201) 634-6570.

include Medicaid and programs for children and adults with special health needs. Because these programs vary from state to state, the CF Foundation recommends that individuals call the social worker at their CF care center to learn what programs and laws may apply to their needs.

To help offset the costs of CF medications, the CF Foundation established CF Services, Inc., a national mail-order pharmacy. This pharmacy provides medications to people who have CF, usually at significantly reduced costs, and makes a determined effort to work with all insurance companies and public programs, such as Medicaid.

Q What research is being done to help people who have CF?

A Because CF is a complex disease, the CF Foundation takes many approaches to treating and curing it. The CF Foundation supports cutting-edge research aimed at finding new ways of treating this devastating disease. In fact, there has been so much progress in understanding CF that the CF Foundation has launched a nationally acclaimed drug development program to help transfer the findings of laboratory science into new CF drugs as quickly as possible.

Such efforts by the CF Foundation and CF researchers around the world have led to a number of experimental treatments that are now entering clinical trials. These new treatments strive to treat every aspect of the disease. For instance, some drugs "fix" the "inner machinery" of cells affected by CF. Other experimental antibiotics may give physicians entirely new approaches to helping people who have CF fight life-threatening lung infections. Finally, another treatment, called gene therapy, actually attempts to replace the defective CF gene with a healthy one. The overall goal of all of these experimental remedies is the same: to increase the quality and length of lives of people who have CF. These promising new treatments must first be proven safe and effective before the Food and Drug Administration approves them for treatment of CF.

Q When will there be a cure?

A No one is able to say when there will be a cure for CF. Today there is more hope for people with this disease than ever before. Some of the best scientists and physicians in the world are devoting their lives to curing this disease. Today, largely because of the tremendous contributions of these individuals, who are often supported by Cystic Fibrosis Foundation research grants, much has been learned. Most important, each new discovery brings us one step closer to the cure. **EP**

Preston W. Campbell III, M.D., is a pediatric pulmonologist and former director of the CF care center at Vanderbilt University. He currently serves as the Executive Vice President for Medical Affairs for the Cystic Fibrosis Foundation in Bethesda, MD.

For more information on CF research, programs and services available to people who have CF, including the CF Services, Inc., Pharmacy, please visit the Cystic Fibrosis Foundation's Web site at www.cff.org; or contact them at the National Office at 6931 Arlington Rd., Bethesda, MD 20814; or call (800) FIGHT CF.

Back and forth, in and out of conventional hospitals and treatment programs. Because complex behavioral issues frustrate treatment of a young child's neurological deficits. Our unique medical and behavioral approach can break the cycle of multiple failures.

SWIMMING IN CYBERSPACE

by Daniel B. Kessler, M.D.

Recently, I participated as a guest expert in a live "chat" discussion on the Internet on attention deficit hyperactivity disorder (ADHD). As a father of two children and a pediatrician who uses the Internet for professional and personal correspondence as well as for research, I was certainly familiar with it. Now I had an opportunity to be the guest expert on a Web site chat. I would be the one to whom everyone would be asking questions, and I was not certain that I wanted to jump into those waters. Ultimately, after discussing the nature of the live chats sponsored by Eparent (www.eparent.com), the Internet version of Exceptional Parent Magazine, and Parent Soup, the parenting division of iVillage.com, the Women's Network, I decided to take the plunge.

In all, I have now done two live chats and survived, and even enjoyed, the experience. Both were discussions on ADHD, an area I have some comfort talking about. A Chat coordinator reviewed my background and credentials and I was all set as the expert.

Come on in—
the water's fine!
My experience with a "live chat" on the World Wide Web

How to Chat

In order to participate in the chat, I needed to download special software into my computer from the chat's Web site. Then the "chat room" opened for business. Upon entering the chat rooms, each person's "chat name" appears both on the "chat board" and on a running list of names of everyone else in the chat room.

Chat names, which do not have to be a person's real name, are the screen names that people use upon joining a chat room. After entering the room, chatters are welcomed by the host. The host informs participants—who are welcome to come and go as they please during the chat—of the topic and who the guest expert is. The chatters are instructed to indicate that they have a question for the expert by typing in a question mark from their keyboard. This mark appears beside their "name" on screen and alerts the host that they have something to ask. The host contacts each participant individually, forms a "queue," or line-up, of participants with questions, and calls on them one at a time. Using this "private messaging" capability, the host asks each chatter to have his or her question typed in and be ready to hit "enter" on the keyboard when his/her turn comes. This keeps the chat flowing at a reasonable pace. Likewise, the expert is supposed to be signaled by the host as to whose question is to be answered next. The expert informs the host when finished with an answer and ready for another question.

In my first experience, people just jumped in and asked their questions or "talked" to each other, greeting each new person entering, saying goodbye as they left the chat room or as they commented on questions. The second time around, after speaking with the Chat Coordinator adn accepting his help and suggestions, I was much better at managing the questions, accepting the help and suggestions of my hosts. I think everyone else enjoyed it as much as I did. All in all, it is not a bad way to spend some educational and fun time. Now I am actually looking forward to my next live chat.

If you find yourself interested in participating in a chat, I would suggest the following guidelines to get the most out of the experience:

- First, learn something about the organization or group sponsoring the chat. Organizations generally provide that kind of information on their sites. Is the organization endorsed by other respected professional groups? Do they provide background material on the topic being discussed? What about the "expert?" What are his or her professional credentials? Is he or she credible? Is it someone you would feel comfortable bringing your child to see?
- It is always a good idea to get to the chat area early because chat rooms can get quite busy. Checking in early with the moderator gives you a better chance of getting the expert to answer your question.
- When asking a question, send it to the moderator with a question mark at the beginning of the message. An expert-led chat is like a question-and-answer session at the end of a lecture. Wait your turn to ask your question. This way, the expert will be able to focus on your question and give you a well-thought-out answer. If you wish to have a side conversation during the chat, use the private messaging system that is available in most chat rooms.
- After the chat, you may be directed to another chat or to a Web site with more information on that topic.
- No matter what you learn from a chat, always review any information or at least discuss it with your child's physician before taking any action. **EP**

Daniel B. Kessler, MD, is Director of Developmental and Behavioral Pediatrics at the Children's Health Center of St. Joseph's Hospital and Medical Center in Phoenix, Arizona. He is also a Clinical Associate Professor of Pediatrics at the University of Arizona College of Medicine. Dr. Kessler's article, "Problems of Behavior and Learning: A Pediatric Perspective" appeared in the June 1998 issue of Exceptional Parent.

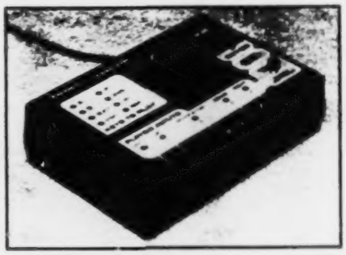
NEW PRODUCTS

FUN & LEARN MAILBOX

This electronic pre-reading tutorial program is designed for use by children between the ages of 4 and 7 years with cognitive and learning disabilities. The mailbox-shaped device uses Leap the Frog to teach the alphabet, phonics, rhyming, and reading comprehension. It also introduces sentence creation, grammar, and early reasoning skills. This talking toy uses three AA batteries, includes 26 talking postcards (one for each letter of the alphabet), and offers three modes of play with six puzzles and games: Object/word identification, spelling, and rhyming. Also included are fun music and sound effects. The unit's face also includes three-dimensional lower case letters of the alphabet. Other standard features include volume control and automatic shutoff.

LeapFrog™ (A Division of Knowledge Kids Enterprises) 1250 45th St., ste. 150, Emeryville, CA 94608; (800) 701-5327

TEAM XTREME™



Team Xtreme™ is designed to enable individuals with upper extremity disabilities to play video games on Nintendo game systems. The unit plugs into the Nintendo system and enables the player to independently play the video games using up to five switches (not included). Each switch can be set up to individually control any key found on the standard game controller and a single switch can also be set up to control two keys simultaneously, allowing two functions, such as moving up and to the right, to be accomplished at the same time. A standard game controller can also be plugged into the unit to allow another individual to be "teamed" with the player to provide assistance when needed. The actions of the teamed players are treated as a single player by the game system and can be adjusted with a switch. The unit also features a connector, enabling commercially available joysticks or ganged switches to be used in addition to four individual switches.

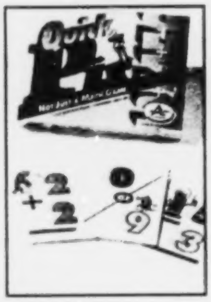
Pathways Development Group Inc. 17409 57th Ave. West, Lynnwood, WA 98037; (877) 742-4604

QCHORD™

The QChord™ Digital Songcard Guitar is an electronic music synthesizer designed for use by children and adults with fine motor disabilities. The device enables the player to make music simply by pressing buttons and moving one hand over the strum plate. This unit features a strumplate that strums like a guitar and a push-button keyboard that plays a range of chords or a melody like a keyboard. The unit, which can be powered with batteries or a plug-in adapter, also features more than 100 instrument voices (acoustic guitar, grand piano, harpsichord, violin, sound effects, etc.) and 10 rhythms (rock, march, waltz, etc.). QChord™ offers multiple skill levels that add more features as players become more proficient.

Suzuki Corporation PO Box 261030, San Diego, CA 92196-1030; (800) 854-1594; http://www.qchord.com.

QUICK PIX™: NOT JUST A MATH GAME



Designed for use by children (age 7 and up) with learning disabilities, this math skills game teaches addition and subtraction skills. The game comprises a set of "answer cards" to be dealt between two to four players. The answer cards are to be paired with the matching question cards as they are turned up one at a time. The goal is to match the correct answer to the matching math question card as quickly as possible and capture the card pairs.

Aristoplay 450 South Wagner, Ann Arbor, MI 48103; (800) 634-7738

ANGELCARE™ SOUND MONITOR AND MOVEMENT REASSURANCE SYSTEM

This unit monitors the slightest of movements by a sleeping infant and sounds an alarm if movement stops for 20 seconds. The system includes a thin motion sensor pad that is inserted under the crib mattress and is plugged into the transmitter unit. The portable receiver unit, which can be operated on batteries or normal household current, monitors the transmitter unit from up to 200 feet away. A movement indicator light flashes at the same rate as the infant's movements. Other standard features include an optional "tick" feature, which enables monitoring of the child's movements by sound; sensitivity adjustment to accommodate mattresses of varying thickness; an on/off volume control; and a power indicator light. The manufacturer states this is not a medical device and cannot be used as an apnea monitor.

Safety 1st, Inc. 45 Dan Rd, Canton MA 02021; (800) 723-3065

The ABLEDATA database of assistive technology and rehabilitation equipment contains information on more than 25,000 products for persons of all ages who have a physical, cognitive, or sensory disability. Products are chosen for this page by the ABLEDATA staff based on their specific applicability to or design for children who have disabilities. ABLEDATA, operated by Macro International Inc., is funded by the National Institute on Disability and Rehabilitation Research under contract number HN-96015001.

Fighting the Ultimate Battle

by Jonah Gillian Bea-Taylor

Mom's Turn:

My son, Jonah Bea-Taylor, is attending Emory University as a freshman this fall. He wrote the following piece for his essay requirement for admission. I believe it reveals one of the many complexities "exceptional" siblings have to face.

Once upon a time, my brother and I played at fighting great battles. We chose our weapons carefully; his sword was wooden, mine plastic. Our arena was the driveway. His chariot was an electric wheelchair, mine was a scooter. We clashed and spun, and both died several times over. We were equal warriors; there were no differences between us.

I was not troubled that people always asked about him. It seemed normal that I was often the only one who understood his speech. Yes, I was sometimes surprised when people stared at us in public places, but most of the time I forgot that he was different.

Jonah, then 15, gives Micah, 10, a helping hand. Below left: The brothers take a break from cycling. Left to right: Mom, Judith, Jonah, and Micah share a smile.

My brother, Micah, has cerebral palsy and is both physically and mentally challenged. He uses a wheelchair and can do very little without assistance. Moving Micah through a world designed for "normal" people is often difficult. Even going to the movies can be a tremendous challenge.

The greatest difficulty for me, however, is my conflict surrounding his care. Some families that have a child with disabilities give many responsibilities to the siblings. My parents, on the other hand, shouldered the burden. They left me with the responsibility to treat Micah like any other brother. We played games, watched movies, and traveled together. My parents took care of his daily needs. I never had to go through the ordeal of taking him to the bathroom, and I rarely fed him at dinner.

It was not my duty to care for my brother, so I was unprepared to truly help when his needs became more demanding. As Micah grew bigger, we could no longer carry him up a flight of stairs. Simply transferring him from the bed to his wheelchair required a significant effort. We hired aids to help, but at times even they experienced difficulties. The constant effort wore on everyone. Micah could never be left alone. Someone always had to be there to lift him, to feed him, to pick things up for him, or to pick him up when he fell over. Suddenly I was needed, but I felt uncomfortable. If only I could say that it felt like a natural progression—that I would have done anything for my brother—that it was not an annoyance to watch him when Mom went out.

Even now I wish I could say that I am willing to make whatever sacrifices are necessary when he needs my help, but I cannot. Perhaps it is selfish, but it would be worse not to acknowledge the resentment the responsibility creates. Still, I feel that I am not devoted enough. I have this rosy vision of what a brother in my situation should be: one who gives his brother everything; one who supports him in all areas, and one who defends him against a world unable to embrace diversity.

I want to help my brother win his battle, but I am not yet a great enough warrior. I am still learning how to fight for myself. I hope to one day solve my internal conflict so that I can stand beside my brother when he needs me. I do not know what the future holds, but I know Micah and I will both grow in our own ways. I know that my understanding of life is profoundly changed. **EP**

Jonah, 19, Micah, 15, and Mom live in Palm Beach, FL.

AMDI Tech/Series Augmentative Communication Devices

The ***Tech/Series*** Communicators are self-contained augmentative communication devices, which permit the user to record and playback each real voice messages in length of 2.25 to 4.5 seconds standard (4.5 to 9.0 seconds extended). All of the ***Tech/Series*** devices are specifically designed to be simple to program and operate. No complicated commands and programming procedures. Additionally, each unit is manufactured to the highest quality standards, and covered under a thirty-day money back guarantee and a full one-year warranty.

5-YEAR
WARRANTY

In a Vail 2000 Enclosed Bed

Now every special-needs child can enjoy the soft, non-threatening security of an enclosed hospital bed – while you enjoy peace of mind knowing that they are softly protected during the night.
Vail Enclosed Beds offer the protection of a soft, sturdy enclosure for:

- Fewer falls and injuries.
- Reduced wandering.
- More relaxed sleep—for your child *and* for you.

For convenience, Vail Enclosed Beds also accommodate medical equipment, fit all ages from child to adult, are frequently covered by insurance, and come complete with mattress, manually adjustabl hospital bed, lifetime service, assembly video and vinyl border and bedskirt. Patterned fabric Decorato Accessories are also available at an additional cost.

Deal directly with the manufacturer.

BRAIN AWARENESS WEEK

JUST USE IT

THE DANA ALLIANCE FOR BRAIN INITIATIVES

Take a week to understand what goes on in your head all year long. Visit www.dana.org/brainweek.

Brain research is finding answers - from understanding how we learn to developing treatments for Parkinson's disease. In the past 10 years, scientists have learned more about the brain than in the previous 100. There have been significant advances in treatments and therapies for depression and other diseases and disorders. And we know the best is yet to come.

Brain Awareness Week is a worldwide partnership between the Dana Alliance for Brain Initiatives and hundreds of national and international organizations. During this year's event, starting March 13, 2000, visit our site at **www.dana.org/brainweek.** When you get there, you'll see how far we've come in understanding the complexities of our brains - and what exciting discoveries await us in the future.

Here's what you'll find.

Calendar: Search for local community events such as lectures, exhibits, school programs and more.

Partners List: Find out who's partnering with the Dana Foundation during Brain Awareness Week. You'll be surprised at the list of over 900 national and international organizations, and you can link to many of them.

Education: This section contains educational resources for children, parents and teachers. You'll find brain-related materials and links to organizations with sites offering valuable tools for home and classroom use.

Puzzles: Download a brain-teasing variety of puzzles and games for children and adults alike.

Graphics: This section includes posters, flyers and logos for Brain Awareness Week.

Community Outreach: Find information on how to plan public programs for Brain Awareness Week. You'll find suggestions about selecting a topic; finding a speaker; the do's and don'ts of writing for the public; and how to plan a media campaign. Plus, you'll see links to publications that offer helpful scientific brain-related information.

So get involved. Start to learn more about your brain, and use us as a resource. This could be one week that changes your whole life for the better.

Brain
Initiatives

Brain Awareness Week. March 13 - 19, 2000.

Brain Awareness Week is a service mark of The Dana Alliance for Brain Initiatives

Circle #31

Just because you don't see carnitine deficiency doesn't mean it's not there.

Carnitine plays a vital role in energy production. Typically, 75% of a patient's carnitine needs are met through dietary intake. And healthy patients depend on proper liver and kidney function to maintain adequate carnitine status. Carnitine functions by binding with fatty acids so they can be transported into the mitochondria for energy production and also binds with metabolic waste products so they can be transported out of the body.

Carnitine deficiency is hard to detect and often overlooked. Patients who exhibit findings consistent with carnitine deficiency should be evaluated for treatment with Carnitor®

Clinical findings associated with carnitine deficiency may be as subtle as any of the following:

- cardiomyopathy
- muscle weakness
- lethargy
- poor muscle tone
- seizures
- low levels of activity
- developmental delay
- slow growth

levocarnitine

Injection 1g/5mL & 500mg/2.5mL
For intravenous use only.

Carnitor® is the only treatment for carnitine deficiency.

For Carnitor® Medicare reimbursement assistance, call 1-800-490-3262.

For any other questions, call 1-800-447-0169.

Adverse events reported with Carnitor® use include nausea, vomiting, body odor, gastritis, and seizures. There are no reported contraindications or warnings. Please refer to the attached brief summary of prescribing information.

For intravenous use only.

Circle #68

Carnitor
levocarnitine

Injection 1g/5mL & 500mg/2.5mL
For intravenous use only.

Clinical Findings Associated with Carnitine Deficiency:

- cardiomyopathy
- muscle weakness
- lethargy
- poor muscle tone
- seizures
- low levels of activity
- developmental delay
- slow growth

Conditions Associated with Increased Risk for Developing Carnitine Deficiency:

- fatty acid oxidation defects
- mitochondrial myopathy
- dialysis
- premature birth
- administration of carnitine- free TPN
- treatment for HIV—especially administration of zidovudine (AZT)
- administration of valproic acid
- administration of pivalate derivatives
- administration of emetine
- administration of sodium benzoate

Adverse events reported with Carnitor® use include nausea, vomiting, body odor, gastritis, and seizures. There are no reported contraindications or warnings. Please refer to the adjacent brief summary of prescribing information.
For intravenous use only.

CARNITOR® (Levocarnitine) Injection 1 g per 5 mL and 500 mg per 2.5 mL. FOR INTRAVENOUS USE ONLY. Brief Summary of Prescribing Information. (Please see package insert for full prescribing information.) **Description:** Levocarnitine is a carrier molecule in the transport of long chain fatty acids across the inner mitochondrial membrane. CARNITOR® (Levocarnitine) Injection is a sterile aqueous solution containing 1 g of levocarnitine per 5 mL ampoule and 500 mg of levocarnitine per 2.5 mL ampoule. The pH is adjusted to 6.0 - 6.5 with hydrochloric acid. Chemically, levocarnitine is (R)-3-carboxy-2-hydroxy-N,N,N-trimethyl-l-propanaminium hydroxide, inner salt. It is a white powder with a melting point of 196-197°C and is readily soluble in water, hot alcohol, and insoluble in acetone. The pH of a solution (1 in 20) is between 6-8 and its pKa value is 3.8. Its chemical structure is: **Empirical formula:** $C_7H_{15}NO_3$ **Molecular weight:** 161.20. **Clinical pharmacology:** CARNITOR® (Levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters. Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® (Levocarnitine) may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted. Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, less than 20 µmol/L at one week post term and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels. **Indications and usage:** For the acute and chronic treatment of patients with an inborn error of metabolism that results in secondary carnitine deficiency. **Contraindications:** None known. **Warnings:** None. **Precautions:** Carcinogenesis, mutagenesis, impairment of fertility - Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that levocarnitine is not mutagenic. No long-term animal studies have been performed to evaluate the carcinogenic potential of levocarnitine. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance. **Pregnancy:** Pregnancy Category B - Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR® (Levocarnitine). There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed. **Nursing mothers:** It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother. **Pediatric use:** See Dosage and administration. **Adverse reactions:** Transient nausea and vomiting have been observed. Less frequent adverse reactions are body odor, nausea, and gastritis. An incidence for these reactions is difficult to estimate due to the confounding effects of the underlying pathology. Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported. **Overdosage:** There have been no reports of toxicity from levocarnitine overdosage. The oral LD50 of levocarnitine in mice is 19.2 g/kg. Large doses of levocarnitine may cause diarrhea. **Dosage and administration:** CARNITOR® (Levocarnitine) Injection is administered intravenously. The recommended dose is 50 mg/kg given as a slow 2-3 minute bolus injection or by infusion. Often a loading dose is given in patients with severe metabolic crisis followed by an equivalent dose over the following 24 hours. It should be administered q3h or q4h, and never less than q6h either by infusion or by intravenous injection. All subsequent daily doses are recommended to be in the range of 50 mg/kg or as therapy may require. The highest dose administered has been 300 mg/kg. It is recommended that a plasma carnitine level be obtained prior to beginning this parenteral therapy. Weekly and monthly monitoring is recommended as well. This monitoring should include blood chemistries, vital signs, plasma carnitine concentrations (the plasma free carnitine level should be between 35 and 60 micromoles/liter) and overall clinical condition. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit. **Compatibility and stability:** CARNITOR® (Levocarnitine) Injection is compatible and stable when mixed in parenteral solutions of Sodium Chloride 0.9% or Lactated Ringer's in concentrations ranging from 250 mg/500 mL (0.5 mg/mL) to 4200 mg/500 mL (8.0 mg/mL) and stored at room temperature (25° C) for up to 24 hours in PVC plastic bags. **How supplied:** CARNITOR® (Levocarnitine) Injection, 200 mg per 1 mL, is available in 5 mL single dose ampoules packaged 5 ampoules per carton (NDC 54482-146-09) and in 2.5 mL single dose ampoules packaged 5 ampoules per carton (NDC 54482-146-10). Made in Italy. Store ampoules at controlled room temperature (25° C). See USP. Store in carton until their use to protect from light. Discard unused portion of an opened ampoule, as they contain no preservative. CARNITOR® (Levocarnitine) is also available in the following dosage forms for oral administration: CARNITOR® (Levocarnitine) Tablets are supplied as 330 mg tablets embossed with "CARNITOR ST" in individual blisters, packaged in boxes of 90 (NDC 54482-144-07). Made in Italy. CARNITOR® (Levocarnitine) Oral Solution, is supplied in 118 mL (4 FL. OZ.) multiple-unit plastic containers. The multiple-unit containers are packaged 24 per case (NDC 54482-145-08). CARNITOR® (Levocarnitine) Oral Solution is manufactured for Sigma-Tau Pharmaceuticals, Inc. By: Alpharma USPD, Inc. Baltimore, MD 21244-2654 and/or for Hi-Tech Pharmacal Co., Inc. Amityville, NY 11701. **Rx only.**

Technology can improve learning opportunities for all children by balancing access and challenge.

72 STRENGTH IN THE FACE OF ADVERSITY: HOW ONE FAMILY MEETS THE CHALLENGE OF DEBILITATING ILLNESS
The second part of our interview with John and Aileen Crowley, parents of three children, two of whom have a life-threatening illness, Pompe's disease.

COVER: Spring and the great outdoors beckons Abigail Rosemary Branson, 17 months—and she's there! Abigail (now 2), who has spina bifida, learned to walk solo with her walker a week after her mom, Susan, snapped this photo. Abigail, her three brothers and sister, and her parents, live in Jackson, MS, where her mom is president of the Spina Bifida Association of Mississippi. Thanks to the Bransons for sharing this photo!

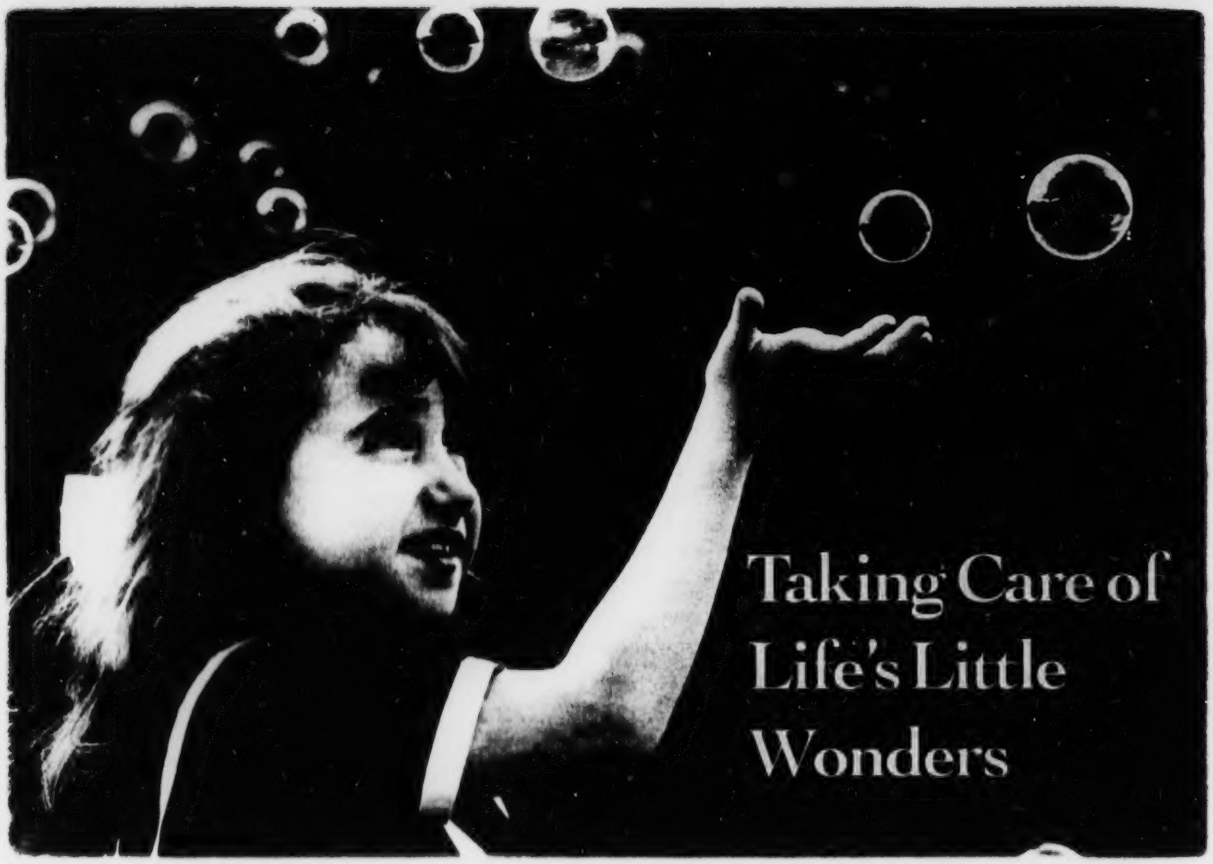
For subscription and advertising information, see page 74



At Children's Hospital, we know what it takes to work wonders in the care of a child. For 80 years, we've provided pediatric care with a philosophy that has remained unchanged—we believe in not only improving the health of our patients, but in enhancing the quality of their lives. As one of the Southeast's largest providers of specialized pediatric services, we take an interdisciplinary approach to treatment, delivering family-centered care through a variety of programs:

- Our **Pediatric Rehabilitation Program** offers inpatient and outpatient services at several locations with customized treatment plans to help each child reach full functional potential.
- Opened in 1999, our **Transitional Care Unit** provides subacute care with active participation of families and goal of transition to home.
- Our **Pediatric Orthopaedic Program** provides services ranging from inpatient surgery to outpatient care—always incorporating the unique needs of each child.
- Our **Assistive Technology Program** offers evaluation and training on the newest augmentative communication devices and daily living aids.
- We have **32 Specialty Clinics** for children with chronic conditions as well as innovative programs like our **Pediatric Feeding Disorders Program** and the **Neurosciences Center for Children.**

At Children's Hospital we understand that quality health care takes more than expertise. It takes vision. And compassion. With this in mind, we are continually expanding our resources to provide for the special needs of all children. Because *every* child is a wonderful gift.

EDITOR'S DESK

Medical Research Update

In the new millennium, we can expect rapid advances in research into the problems of all people with disabilities and healthcare in general. This month's issue takes a look at what's new under the sun. We also introduce our Medical Research Update column, which will regularly report on medical research relevant to families who have a member with a disability. We welcome the input and contributions to this column from organizations dedicated to particular disabilities.

We are close to describing the total DNA structure—the genetic code that dictates the host of tiny details that makes each one of us who we are. In "The Human Genome Project and the Medicine of the Future," Karin Jegalian, PhD, and Leslie Biesecker, MD, both of the National Institutes of Health, provide an update on the project and what it will mean to all of us.

We have assumed for a long time that this knowledge would lead to therapies which would directly attack problems in the genetic structures that cause so many disorders. However, in the past weeks, great doubt has been cast on the "successful" gene therapy reports we have read in the past several years. The National Institutes of Health has called a halt to the work at The University of Pennsylvania Medical School.

Newspapers have contained articles on the deaths and serious failures in gene therapy that had not been reported. On February 2, 2000, a Senate subcommittee on health began a week of hearings on gene therapy they hoped would contribute to guidelines that would allow the research to continue in a safe, productive fashion. In this issue, Abbey Meyers, executive director of The National Organization on Rare Diseases and a member of a NIH oversight committee, provides a unique overview of the current state of gene therapy research, as well as its problems and prospects.

In debates about "publish or perish" as a basis for tenure at universities, the critical role of research there has been obscured. The current dilemma in gene therapy can be understood by contrasting the role of a university with the role of a private company. When research is done in a university setting, the guiding philosophy has always been to share publicly all information with everyone. In contrast, research sponsored by a private company is guided by the need for privacy to preserve the rights to patenting products. Finding a balance between these two contrasting philosophies has never been more urgent.

Also in this issue

We have included a reprint of the Executive Summary of Defining Medical Necessity, a report developed with the support of the National Policy Center for Children with Special Health Care Needs and the Joseph P. Kennedy, Jr. Foundation. Insurers use this definition of medical necessity to govern whether they will support medical treatments or purchases of adaptive equipment. In upcoming issues we will discuss the problems families often confront when they are denied services and possible solutions. Information on how to obtain the entire report, which is free of charge, is included with the article.

Dr. John Botti, past president of the National Perinatal Association (NPA), describes the role the perinatologist plays in caring for women who are at high risk for having a child with a disability. This article begins a series in which the NPA will introduce us to the various specialists involved in helping promote the growth and development of children with disabilities. The aim of the NPA and these articles is to make families more active and effective participants in the care of their children.

We continue the interview with Aileen and John Crowley, our Hall of Fame parents. In this issue, they describe their management of their health insurance with an example of an arrangement that provided their children with better nursing care and also saved the insurance company money. They also summarize their experience with practical advice for all parents. We hope to revisit them in our ongoing search for important parental wisdom.

This month, CAST, the Center for Applied Technology, based in Peabody, Massachusetts, discusses their Universal Design for Learning™. The concept, which the group pioneered, uses technology to allow students of all learning abilities to access the ordinary curriculum. With judicious use of computers, access can be gained without losing the challenge necessary to stimulate learning.

Our Role Model for March is Jay Leeuwenburg, an offensive lineman with the National Football League's Cincinnati Bengals. At twelve he was diagnosed with juvenile diabetes, a lifelong chronic illness. His family's approach to informing his classmates and teachers about the problems he was facing and their ability to help him learn the importance of taking his daily medication is a lesson for all families whose children have chronic health problems. His ongoing work with the Juvenile Diabetes Foundation is a tribute to him as well as his family.

Hold this date: May 28-May 31, 2000

We are pleased to announce that EP will collaborate with the prestigious MassGeneral Hospital for Children to present a conference and exhibit, Humanizing Health Care for Children and Families: The Art of the Relationship. This promises to be an informative and exciting endeavor, and we hope you will be a part of it. Look for more information in upcoming issues.

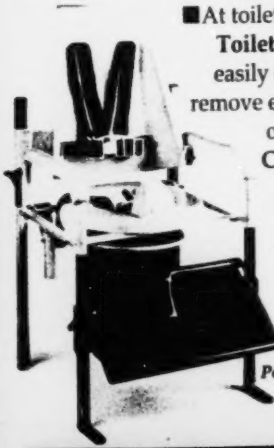
Sally, 40 lbs. and 45" tall, in the #8600 Reclining Bath Chair with #8875 Head Pad

Sharing the Caring

Columbia offers you solutions to the daily challenges of bathing, toileting and transporting your child – ***with comfort, safety and ease!***

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

- At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.



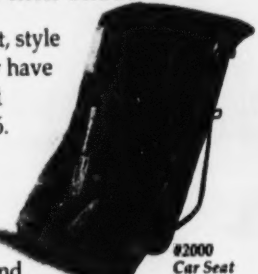
#5800 Hi-Back Positioning Commode for junior adults

- At bathtime, our popular **Wrap-Around Bath Supports** and **Reclining Chairs** allow your child – and you – to enjoy the bath.

#7200 Wrap-Around Support

#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.

- When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! Comfort, style and adjustability have made it the No. 1 choice since 1986.



#2000 Car Seat

Why do these products work so well?

Much thought and care go into the design of each Columbia product. We make each item in the **right size for your child,** with lots of adjustability for a custom fit. They are made of durable materials, proven in real life. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.

Get all the details from our FREE full color catalog. "Sharing the Caring" means *products that work!*

Aggressive behavior

My 12-year-old daughter was diagnosed with hypomelanosis of Ito (a rare disorder characterized by an unusual lack of skin color affecting many areas of the body and associated with other symptoms, such as mental retardation, seizuresvisual and ocular defects, overgrowth of brain tissue, and/or a small head) at the age of 2 years. She also has a seizure disorder, moderate cognitive delays, and many behaviors that are typical of attention deficit-hyperactivity disorder (ADHD). The most difficult part of her disability, however, is that she swats at and hits others, especially children who are smaller than she. This happens if she feels threatened or anxious, e.g., if a small child suddenly comes too close. This limits her opportunities for inclusion in school and recreational activities and makes it difficult to find respite care. We have tried medications for behavioral disorders such as ADHD (Ritalin® and Paxil®), but the behavior has persisted. As my daughter gets older and larger, she encounters less understanding and tolerance from others. I am looking for ideas on other medications and treatment.

J.B., via the EP Web site

How to keep diapers in place

My 5-year-old daughter has spina bifida and has no feeling from the waist down. A vesicostomy (a surgically created opening below the navel) was performed so that her urine currently drains into her diaper and a surgical pad. When she moves around, her diapers pull down, and her pants and shirt get wet. I would appreciate any ideas on ways to keep the diaper pulled up so that she can stay dry.

C.S., via the EP Web site

Dealing with frustration

My 7-year-old daughter used to walk independently and could feed and dress herself. She had a stroke i September and lost most of he functional vision. We are no arranging testing to determine th extent of the stroke. Our greatest problem at this point is her mood. She does not really communicate, and she gets frustrated very easily. Whenever she is faced with something difficult, she has a temper tantrum. It is getting increasingly difficult to handle her. I would appreciate any ideas on dealing with her frustration and temper tantrums.

J.M., via the EP Web site

Swing needed

My 8-year-old son has Angelman syndrome. He has outgrown his baby-toddler swing, and I would like to find one that fits him. A regular swing with a back on it or a net swing would be great. Does anyone know of any companies that offer this kind of equipment?

M.V., via the EP Web site

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. We also expect parents to consult appropriate professionals.

Please indicate whether the letter is a Search or a Respond. If it is a Respond, be sure to note in which issue the original Search letter appeared. All responses are forwarded to the writers of the Search letters; some are published. Published letters may be edited for purposes of space and clarity. Please remember to include a phone number in the event that more information is required.

Write or fax: Search or Respond, *EXCEPTIONAL PARENT*, 555 Kinderkamack Rd., Oradell, NJ 07649-1517, (201) 634-6570 or visit Search and Respond on our Web Site: http://www.eparent.com. For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518 (http://www.NORD-RDB.com/~orphan). Also, see "National Resources for Specific Disabilities and Conditions" in *EXCEPTIONAL PARENT's* 1999 Resource Guide (January 1999).

The National Parent-to-Parent Support and Information Service (NPPSIS) is a not-for-profit service that keeps track of children with diagnosed and undiagnosed disabilities whose parents are looking for a match. Parents are matched with a "veteran parent," with an older child who has a similar condition and is willing to provide guidance and support. Contact: NPPSIS, P.O. Box 907, Blue Ridge, GA 30513; (800) 651-1151 (V/TTY) or (828) 494-5415; (828) 494-5414 (fax); E-mail: nppsis@elijay.com; Web site: http://www.nppsis.org.

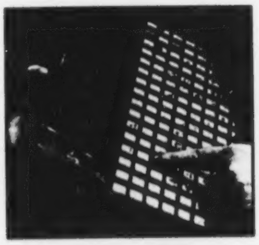
Circle #61



Probable metabolic disorder

H.H., December 1999 (via the EP Web site), has a son who is undiagnosed. He has feeding difficulties, a seizure disorder, developmental delay, and a high level of lactic acid in the blood. She requested information on further testing to help determine a diagnosis, and also wanted ideas on seizure medications that would not make the mitochondrial disorder worse.

Your situation reminds me of my own 11-month-old boy. He spent his first 3 weeks of life in the hospital because of seizures, lethargy, and failure to suck. All test results were normal except the EEG, and he had a carnitine deficiency, for which he received treatment. The doctors thought that the low carnitine levels might be because I am a vegetarian. After a month on treatment, his carnitine levels were high and the treatment was stopped. Now his carnitine levels are low again.

His seizures are now controlled with medication. He has cortical vision problems, reflux, and constipation. His muscle tone is very low and his motor development is delayed. He can only sit for a few seconds at a time and has not developed any equilibrium reactions. The muscles in his arms are very tight. We see a geneticist but would like to get a second opinion. Our next step is muscle biopsy, as we are desperate for answers.

Cheryl, via e-mail

Autism and toileting issues

D.F., December 1999 (via the EP Web site), has a son who has autism and severe cognitive deficits. He seems to have a compulsion to touch his feces and rectum. She requested ideas for behavioral intervention.

Our 7-year-old son has multiple disabilities, including cerebral palsy, mental retardation, cortical blindness, seizure disorder, and hydrocephal (he has a shunt). He also has ma behavioral characteristics that ar typical of autism.

We discussed the problem of feces smearing with behavioral experts who agreed that the most effective method is to make it impossible to get to the feces.

We use bib overalls, one-piece pajamas, and have even made a "onesie" for larger boys. This is somewhat of a nuisance, because our son has a G-tube and this makes feeding difficult. It seems, however, that if we can break this cycle of behavior for a couple of months, he forgets it for a while.

The behaviorists could not explain why someone would want to smear feces, but suggested that it may have to do with their texture and smell. They suggested offering him gooey materials, such as silly putty or finger paints, for play.

Your child's disability may have been preventable

Your child may have been harmed by something that happened during pregnancy, labor, or delivery, or by exposure to a toxic substance. Parents often have no way to know what might have caused their child's disability.

Let us review whatever information you have about your child's disability. If it turns out that the disability was preventable, your child may be entitled to receive compensation to pay for the best care available, as well as for all the other losses.

Call us today toll free from anywhere in the United States at 1-800-THE-EAGLE for a free consultation to discuss whether legal representation might help you and your child.

Goldberg & Osborne is an Arizona law firm that will associate with lawyers experienced in birth injury cases throughout the United States, in order to provide you with quality legal representation in your state.

WHAT DOES THE WORLD LOOK LIKE TO A FOUR-YEAR-OLD? *Just ask one.*

Consider for a moment what the world looks like to a four-year-old. It's something we do quite a bit at MassGeneral Hospital for Children. We look at the world from the child's perspective because we understand how important it is that you and your child feel secure while you're with us. By partnering with you, the parents, we can better understand each child – inside and out. Then together, we make care decisions that are specially suited for the child's individual needs. When it comes to caring for children, we've been recognized as one of the best in the country. So when you choose MassGeneral Hospital for Children, you'll feel confident your child will receive world-class family-centered care from people who truly remember what it's like to be a child. To find out more about our program and the full complement of primary care physicians and specialists or to receive our directory of physicians, call 1-877-KIDSMGH. The MassGeneral Hospital for Children is a hospital within Massachusetts General Hospital, a member of Partners HealthCare System.

CONFERENCE 2000

Humanizing HealthCare for Children and Families:
The Art of the Relationship

Formerly ACCH annual conference

The conference explores the importance of relationships and partnerships between families, professionals, community, businesses and government within the health care setting.

Topics include:
- Spiritual Care
- Emotional Support
- Community / School Integration
- Helping Children with Sickness and Death
- Family Centered Care
- Volunteer Programs, Child Life Initiatives, Child and Family Advisory Committees
- Family Resource Rooms
- Creating Healing Environments

For further information on this exciting conference or to obtain a conference brochure please contact Mary Lou Kelleher at the MassGeneral Hospital for Children at 617-724-5720 or by e-mail: mkelleher@partners.org

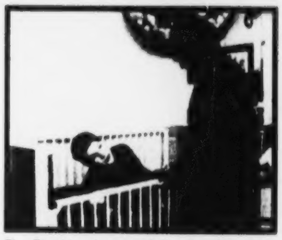
HARD MANUFACTURING

AGE APPROPRIATE
BEDS

For when your child passes the crib stage!

Dianna Fitzgerald
& Her Son Nicholas



The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"... saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

For information about our full line of beds and cribs,
as well as locating your nearest HARD dealer, please give me a call.

Dear Parents:

When my son was born with brain damage, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

GENE THERAPY

Balancing the Promise With the Reality

by Abbey S. Meyers

On September 17, 1999, four days after receiving a gene therapy infusion at the University of Pennsylvania, a young man from Arizona who had a genetic disease known as Ornithine Transcarbamylase Deficiency (OTC) died. His death—the first that could be directly linked to gene therapy—electrified the scientific community and triggered a national debate that will have a powerful impact on the future of gene therapy experiments and how they are approved and monitored. These are profound and important questions left unanswered, but for Jesse Gelsinger, the 18-year-old who died, and perhaps for others, it is a debate that came too late.

WHAT IS GENE THERAPY?

The concept of gene therapy was born when scientists theorized that if they could replace faulty genes with good ones, they would be able to cure hereditary disorders. The problem was how to get good genes into cells. Scientists knew that cells were masterful at protecting themselves, and that it would be important to insert new genes in a way that left them intact and able to function. They realized that one of the few entities that could enter a cell and reside inside for a long period of time was a virus. Thus, they launched a series of animal experiments using a genetically modified virus (called a "vector") that would carry a desirable gene, much like a passenger in a taxi, and drop it off in the targeted cell. To assure that the virus would not multiply and cause disease in the recipient, they modified it so it could not replicate after it delivered the gene.

During the1980s, scientists working in this field realized that if gene transfer worked in humans, it would raise profound moral and ethical questions. Gene therapy, they theorized, could change the human race if there were no ethical parameters and no regulatory boundaries that scientists would have to obey. Moreover, designing new viruses would trigger environmental questions that could potentially pose new risks to humanity. In light of all this, they met together and proposed that the government should create an oversight structure called the Human Gene Therapy Subcommittee of the Recombinant DNA Advisory Committee (which is known as the "RAC"), to review pending gene therapy experiments and monitor the progress of the technology. These scientists felt that if gene therapy experiments were reviewed and discussed in open meetings by ethicists, scientists, and members of the public, it would build public trust and reduce fear of genetic engineering. The major threat to the future of gene therapy, they surmised, would be public suspicion that experiments conducted behind closed doors might lead to the creation of genetically engineered humans, potentially turning frightening science fiction into reality.

GOVERNMENT REGULATION

As a result of these recommendations, the National Institutes of Health (NIH) created the Human Gene Therapy Subcommittee, which developed a list of rules that scientists would have to abide by before, during, and after they transferred new genes into humans. These rules are parts of the "NIH Guidelines for Research Involving Recombinant DNA Molecules," and they are known as the "Points to Consider." The rules must be obeyed by all scientists who receive federal funds, as well as by private companies when treatment of patients is provided at a hospital that receives federal funds, such as Medicare or Medicaid. After the RAC would approve a protocol, scientists would have to obtain FDA approval before an experiment involving humans could begin.

EARLY TRIALS

Even though gene therapy was conceived as a technology that would treat or cure genetic diseases, within a short period of time, the great majority of experiments focused only on cancer. This was primarily because gene therapy experiments are very expensive, and the NIH was not generous in its funding to academic investigators who wanted to pursue gene therapy. The federal government funded only three vector manufacturing facilities, so the private sector stepped in, and pharmaceutical companies sponsored trials at an increasing rate each year. Pharmaceutical companies know that genetic diseases are generally rare, and there would be much bigger and more lucrative markets for products to treat common diseases such as cancer or heart disease. As a result, the field turned away from the genetic diseases it was most likely to cure, and moved toward diseases for which it was easiest to get funding. By September, 1999, the RAC had approved 295 gene therapy protocols, 206 of which were for cancer.

The first human trial of gene therapy was for Severe Combined Immune Deficiency (SCID), more commonly known as the "Bubble Boy Disease" because of the young Texas boy who lived for years in a plastic bubble that protected him from germs. However, just before the SCID experiment was launched, a pharmaceutical company had developed an "orphan drug" that replaced the missing enzyme (adenosine deaminase) in children with this disease. Thus, this type of SCID was no longer an untreatable and deadly genetic disorder, so the RAC required the investigators to continue giving the children the drug until they could prove that the transferred gene made injections of the enzyme unnecessary.

...A NATIONAL DEBATE THAT WILL HAVE A POWERFUL IMPACT ON THE FUTURE OF GENE THERAPY EXPERIMENTS AND HOW THEY ARE APPROVED AND MONITORED.

This initial gene transfer protocol received extraordinary publicity, and even today the public believes it was successful. In terms of transferring the needed gene, it was indeed successful; but, the fact is, the new genes were unable to manufacture enough of the enzyme to make any difference in the children. Even now, the children with SCID who have received gene therapy treatments still rely on the injectable enzyme. However, the positive news about this experiment became a pattern that persisted in the news media: report the good news and ignore the negative facts.

In time, the Gene Therapy Subcommittee was merged into the RAC, and even today the RAC continues to review gene therapy protocols in a public forum every three months. Every six months, the RAC is given a report on the progress of all approved protocols. These reports are supposed to disclose how many patients have been enrolled in each, any adverse events that have occurred, and the causes of any deaths. However, over time, as the RAC would review the progress reports, its members noticed that few adverse events were being reported, and several critical questions were not being answered.

For one thing, probably because the great majority of experiments have been on terminal cancer patients, there have been many deaths. However, there is no way to tell for certain whether the deaths are in any way related to the gene transfers. This is because one would reasonably expect that terminal cancer patients would die of cancer if the gene transfer did not help them. Also, to date, gene therapy has not been therapeutic, no one has been cured, perhaps because of the efficiency of the human immune system. Since most experiments have used vectors called "adenoviruses"—viruses that cause common colds in humans—an immune response would naturally be triggered to destroy the virus and its passenger, the new gene.

Furthermore, the NIH Points to Consider require that, in the event of a patient's death (for any reason, whether related to the gene therapy or not), an autopsy will be requested to determine whether the vector or transferred gene played any role in the death, and whether the new gene reached the patient's reproductive organs (which might indicate unintended consequences for future generations). These are important questions. But today, after approximately 3,000 humans have participated in gene transfer experiments, only a handful of autopsies have been done.

The Push Toward Deregulation

During the mid 1990s, the pharmaceutical industry complained that too much time was being wasted in the RAC review process. So the NIH was completed to change the rules. Experiments that were not unique, and those that used vectors that had already been utilized in numerous other experiments, would no longer have to be reviewed by the RAC in a public forum. They would go directly to the FDA. Only novel protocols using new vectors, or experiments on new diseases that were not previously the subject of gene therapy investigations, would continue to be reviewed by the RAC.

Once a protocol goes to the FDA, it becomes enshrouded in protective secrecy because the FDA considers all information a "trade secret" unless the sponsor agrees to release data. Since most gene therapy protocols were simply dupli-

continued on page 22

No one has been cured, perhaps because of the efficiency of the human immune system, since most experiments have used vectors called "adenoviruses"

continued from page 21

cations of experiments already under way, there was no protest against this change of the rules. Although many people asked why there was a need to rush experiments that had shown no therapeutic benefit, there was no formal objection registered to trigger a public dialogue about this change in NIH rules.

Biotechnology companies complained that the RAC was unduly restrictive. The industry said it was regulated by the FDA, and therefore it was improper for the NIH to impose its rules on private companies. To everyone's surprise, in the spring of 1995, the NIH director, Dr. Harold Varmus, announced that he was going to dissolve the RAC. This meant that there would be no further public discussion and no public input into gene therapy investigations. If a scientist decided to transfer genes to make a person taller, or smarter, or change his hair or skin color, there would be no opportunity for ethical objections. Investigators could stop pursuing cures for diseases and redirect their studies to cosmetic gene therapy, which might ultimately threaten the diversity of the human race through engineering of "designer children."

Doctor Varmus' announcement provoked an outcry, not only in the United States, but around the world. Other countries admired what the RAC was doing, and they had created their own RAC-type regulatory bodies to monitor gene therapy experiments. When members of Congress protested, Dr. Varmus changed his mind. One year later he announced that he would reduce the RAC from 25 members to 15, and no longer allow them to vote for or against approval of protocols. However, the RAC would continue to exist. The weakened Committee's only remaining tool was to serve as a pulpit against scientific excesses.

Between December 1995 and December 1996, there were no RAC meetings while a political battle raged among the NIH, Congress, and the public. One of the last protocols that the RAC approved, before its meetings were halted in 1995, was for a genetic disease called Ornithine Transcarbamylase Deficiency (OTC), which is a rare urea-cycle disorder. The urea-cycle disorders are characterized by enzyme deficiencies or enzyme abnormalities that can cause excessive elevations of ammonia in affected individuals. Children with this disorder go into a coma and they usually die. However, an orphan drug is now available to treat many of the urea-cycle disorders, including OTC. If an individual with a mild genetic defect for OTC takes the medicine and follows a strict diet, he or she may live a nearly normal life.

The scientists who proposed the study wanted to inject the vector (an adenovirus) into the artery leading to the liver of individuals with OTC deficiency, and they wanted to do the experiment on children. The RAC disagreed. Because OTC Deficiency was a treatable disease, the RAC told the investigators they had to do the experiment on adults (over 18 years of age), and they could not put the vector into the liver because of concern that it might cause a severe reaction. Instead, the RAC told the investigators to put the vector into a vein via intravenous infusion. The scientists agreed to make these changes, and the newly designed protocol was approved.

CRISIS TRIGGERS REFORM

Following Jesse Gelsinger's death, an autopsy confirmed that the adenovirus had triggered an overwhelming attack by his immune system which destroyed his liver and other organs. Within days, the Washington Post reported that at least six more deaths had occurred in other gene therapy experiments that had not been reported to the RAC. Additionally, the FDA was aware of several deaths and severe adverse events from gene therapy that were not reported to the RAC. The sponsors of those studies claimed these were "trade secrets," and refused to allow the FDA to release the information. Moreover, even though the investigators on the OTC experiment were required to report any changes to the protocol after the RAC reviewed it, they did not inform the RAC that they had decided to infuse the vector into the liver despite the RAC's instructions not to do so.

The tragic death of Jesse Gelsinger has raised many profound questions that will haunt the field of gene therapy for years to come. Why haven't investigators and companies obeyed the RAC's reporting rules? Why have they kept important information secret? Why have only the positive results been released to the news media? Under what circumstances can a company ethically claim that a death is a "trade secret?" With the potential to alter the human race, who's purpose is served if this research is done behind closed doors? And, most of all, why have two critical government agencies—the FDA and the NIH—competed instead of cooperated when lives were at stake?

The industry may have felt that it was important to claim success prematurely because this is the only way to raise investment capital. But, by withholding the truth, they were not being honest to their stockholders, or to the brave patients who volunteered to participate in clinical trials. Many patients were led to believe that, while gene therapy technology does not work very efficiently, at least it is safe. If adverse events were not reported to the RAC, as required patients who considered participating in the trials had no way to learn the truth. For example, in the OTC experiment, three patients who had participated before Jesse Gelsinger had abnormal liver enzyme tests after the vector was infused, and several monkeys had died before the vector was given to humans. However, these facts were hidden from potential participants, and not reported to the RAC until after Gelsinger died.

A major aim of the RAC is to share information so that mistakes can be avoided by other gene therapy scientists around the world. In that way, precious resources will not be wasted duplicating experiments that have already been done. It is not yet clear whether Dr. Varmus' attempt to dissolve the RAC in 1995 encouraged investigators to ignore the RAC's rules and hide the truth in the field of gene therapy. Why was the private sector allowed to dominate the field when the NIH knew that much more basic research was needed to make gene therapy safer and more effective?

The soul searching that has occurred since the Gelsinger death marks a turning point in gene therapy research. It has made the value of the RAC more obvious and the importance of public participation in research dialogue painfully clear. History has shown that scientists will sometimes go to

continued on page 24

> ONCE A PROTOCOL GOES TO THE FDA, IT BECOMES ENSHROUDED IN PROTECTIVE SECRECY BECAUSE THE FDA CONSIDERS ALL INFORMATION A "TRADE SECRET" UNLESS THE SPONSOR AGREES TO RELEASE DATA.

THE MELMARK SCHOOL

Where education and love go hand in hand...
expanding life's options for special children.

Approved private boarding and day school, serving children ages 4 through 21 with:

- *Neurological impairments*
- *Autism/pervasive development disorder*
- *Mild to profound mental retardation*
- *Medically fragile and/or complex*
- *Challenging behaviors*

Our services include:

- *High student/teacher ratios*
- *Applied Behavior Analytic Programming*
- *Psychological, physical, speech, occupational, aquatic and hippotherapy*
- *On-site physicians*
- *24 Hour nursing*
- *Social, recreational & athletic programs*
- *Multi-sensory stimulation*
- *Family support services*
- *Community activities*

We also provide:

- *Respite Care (a vacation customized to student's needs)*
- *Summer Camp*

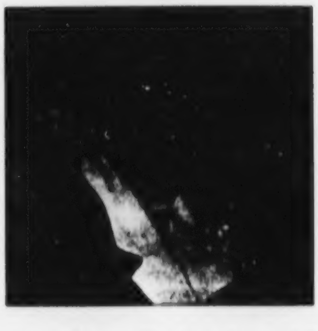
continued from page 23

extraordinary lengths to test their hypotheses, sometimes overlooking patient protections. As a society, we cannot allow gene therapy scientists to perform experiments in secret that could affect future generations of unborn children, just because they want to prove a point.

Other troubling issues persist, however. Some see the day when "designer children" become a reality, and parents will be able to choose their babies' eye and hair color, IQ, height, and weight. While most people feel this concept is distasteful, some are eager and willing to pay for the privilege. In a country that does not even guarantee every citizen the right to health insurance, one can only imagine the widening medical gap between rich and poor if we could buy access to a technology that would change our genes. For example, who will decide which skin color is preferable? Will those who do not have the proper skin color suffer as outcasts? Will diversity eventually become a crime?

Ultimately, it is the way this gene therapy controversy has affected patients that is most disturbing. During the past decade, families with hereditary diseases felt it would soon be possible to replace faulty genes with good ones, so that future generations could be born disease-free. Now they know this is not true, and the dream is not yet a reality. It may take another decade or more before safe and effective gene therapy can be developed with new vectors that will not arouse the immune system. The best thing that can come out of the tragic death of Jesse Gelsinger is that patients who volunteer for clinical trials will be treated honestly, so they understand the risks. Scientists and corporations will be more sensitive to the public's need to know what they are doing, and finally, families will not base important medical decisions on news reports that were aimed at Wall Street and only accidentally filtered down to Main Street.

Someday gene therapy will accomplish all the miraculous medical achievements it was conceived to do. But when this happens, we will learn about it from peer-reviewed medical journals, not the nightly news. And when gene therapy is finally deemed safe and effective, the challenge will be to confine its use to the treatment and cure of diseases, thus preventing re-engineering of the human race. **EP**



Abbey S. Meyers is the founder and president of the National Organization for Rare Disorders (NORD). Ms. Meyers was a member of the NIH Gene Therapy Subcommittee from 1989 to 1992, and the Recombinant DNA Advisory Committee (RAC) from 1993 to 1996. She served as the consumer representative on these committees. She has three children with a genetic disease, and five grandchildren who are "at risk" of inheriting it.

Inroducing the
CREEPSTER CRAWLER
Imagine the thrill of seeing your child crawl for the first time...
Children without head control or the ability to roll-over or belly crawl have developed mobility in the Creepster Crawler. It has been beneficial for children with physically limiting conditions including: • Cerebral Palsy • Spina Bifida • Down Syndrome • TBI, and developmental delays. It has been used successfully by children having tracheostomies and G-Tubes. It can also provide a head start to more advanced mobility down the road.
Special Design Features
The frame has a padded platform that can support a parent from above to make it easier to work on weight bearing, weight shifting, reaching and creeping. Front shoulder and chest straps may be adjusted for individual fit.

Gold Corporate Sponsor:

ALLERGAN

Allergan: Quality Products for the Special Needs Community

Allergan, Inc. is proud to help sponsor the World Congress and Exposition on Disabilities, being held November 10-12, 2000 at the Georgia International Convention Center. As a Founding Sponsor of this first-ever forum for the disabled and those who care for them, Allergan demonstrates its continued commitment to helping provide top quality products in service to the special needs community.

"We are pleased to be part of this World Congress and Exposition," says David Pyott, CEO and president of Allergan. "We feel it will present an important venue for informing persons with disabilities and their caregivers about the products and services that are available to them."

Allergan has a long history of supporting endeavors intended to facilitate discussion and cooperation between doctors and patients with disabilities and their families. Focusing on specialty pharmaceutical products that satisfy unmet medical needs, Allergan has convened advisory panels, seminars, and professional meetings around the world to learn more about their professional customers and the patients they serve, and to inspire the search for new, innovative therapeutic treatments for persons with disabilities.

In addition to supporting dialogue with doctors and patients, Allergan is convinced that its basic and clinical research will continue to yield products that dramatically improve the quality of life of disabled patients and others.

Allergan has invested heavily in researching treatments for movement and eye disorders. Of particular significance is the company's commitment to retinal and neural disorders, such as glaucoma and age-related macular degeneration. These diseases are the leading causes of blindness in the developed world. The company develops and commercializes products in the eye care and specialty pharmaceutical, ophthalmic surgical device, and over-the-counter contact lens care markets, as well as in the movement disorder and dermatological markets, while seeking to satisfy unmet medical needs and improve patients' lives.

Allergan continues to invest in leading-edge technologies, such as receptor-selective retinoids, as it seeks out future technologies that will take the company beyond the eye and skin markets and position it as a worldwide leader in specialty pharmaceuticals.

Allergan is the manufacturer of BOTOX" (Botulinum Toxin Type A), Purified Neurotoxin Complex .There are presently a number of BOTOX "clinical trials underway for a variety of uses. BOTOX" has been extensively studied in humans for over a decade.

Allergan, Inc., headquartered in Irvine, California, is a technology-driven, global health care company providing eye care and specialty pharmaceutical products worldwide. Allergan develops and commercializes products in the eye care pharmaceutical, ophthalmic surgical device, over-the-counter contact lens care, movement disorder, and dermatological markets that deliver value to our customers, satisfy unmet medical needs and improve patients' lives.

on, technology and a whole lot of fun!

The first international forum of "information that matters from people who care" for people who care: families and professionals in science, medicine, education and advocacy.

Exceptional Parent Magazine and H.A. Bruno, LLC invite families of people with disabilities and professionals from the fields of healthcare and education from across the United States, Canada and around the world to share information, strategies, experiences, ideas and innovations.

A World-Class 3-Day Event

Join forces and voices for people with disabilities

For Families and Direct Service Providers: Experienced parents and professionals share first-hand, hands-on and first-person strategies and techniques for planning and problem solving in the home, the family, the community and the world at large. 400 associations are invited to share programs, projects and advocacy ideas.
Agenda items: insurance, schools, recreation, estate-planning, health care providers, employment, assessibility, technology, and many more.

For Physicians, Physical Therapists, Occupational Therapists and Educators: International experts discuss movement and brain disorders in symposia, lecture and workshop settings. Emory University's School of Medicine provides CME credits and administers a call for papers. Professional associations are also invited.
Agenda items: ataxias, spasticity, Tourette, Parkinson's, epilepsy, AD/HD, newborn screening for inborn metabolic errors, mitochondrial diseases, infant nutrition, learning disabilities, and many more.

For Those with Disabilities: Opportunities for information and hands-on introductions to the latest innovations in technology, health care, fun and advocacy.
Agenda items: Hands-on workshops in technology and educational software, sports and recreation activity center, Career Fair featuring live interviews with major corporations, the best toys, games and videos for fun and educational use and many more.

Village, Assistive Technology, Inc., Baby Jogger, Children's Healthcare of Atlanta, Children's Hospital, Columbia Medical Systems, Guldmann, Keybowl, Kimberly-Clark, Lifestand, MetLife Financial Services, New Mobility Magazine, (Pediatric Neurotransmitter Disease), Pride Mobility Products, R. D. Equipment, Sigma-Tau Pharmaceuticals, Sports and United States Disabled Athletes Fund. And the list is growing. Check next issue for more!

Paralympic and National Level Athletes to Demonstrate Their Abilities at WCD

The U.S. Disabled Athletes Fund (USDAF), a national non-profit organization, will present top athletes in sports demonstrations at the World Congress & Exposition on Disabilities, November 10-12, 2000 at the Georgia International Convention Center in Atlanta. Demonstrations will be held every day of the show and where appropriate, spectators—both able-bodied and disabled—will be involved. Sportsbeing demonstrated include: Wheelchair Track, Wheelchair Rugby, Wheelchair Tennis, Wheelchair Basketball, Wheelchair Fencing and Track for the Visually Impaired, as well as Orthopedic and Prosthetic Track and Field. Athletes expected to appear include numerous Paralympic medallists, members of the Atlanta Rolling Hawks and Rolling Thunder.

As the successor organization to the Atlanta Paralympic Games, the USDAF was developed as a non-profit organization to address the needs of children and adults with disabilities to have the opportunities to participate in sports. The mission of the USDAF is to advance the disability sports movement in the United States to improve the quality of life and economic self-sufficiency of Americans with physical disabilities. In working toward this mission, USDAF developed BlazeSports, a state-funded model program to deliver sports for persons with disabilities from beginning levels through to training and competition opportunities for elite athletes. The focus of USDAF is two-fold: 1. To serve as a catalyst for the development of organized sports programs for children and adults with physical disabilities; and 2. To foster the expansion of these programs into local communities so that children and adults with physical disabilities have the same opportunity to experience the benefits of sports and recreation as their able-bodied peers.

At the grassroots level, the BlazeSports program offers five Paralympic sports throughout Georgia through Parks & Recreation Departments. The schedule has not yet been finalized but will be available soon on www.wcdexpo.com. Those interested in contacting USDAF may do so at http://education.gsu.edu/blazenet or blazesports@mindspring.com. or by telephone at 770850-8199, fax 770 850 8179.

THE HUMAN GENOME PROJECT

and the Medicine of the Future

by Karin Jegalian, PhD and Leslie Biesecker, MD

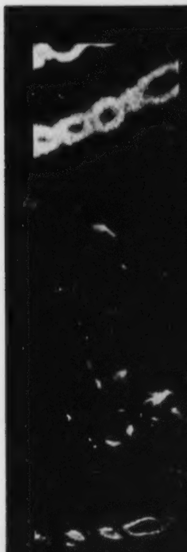
The most ambitious biological science project ever conceived is under way and will profoundly affect how medicine is practiced in the next century. This project is the Human Genome Project (HGP), and its goal is to determine the DNA sequence of every gene in the human body. The HGP is fueling rapid discoveries into the genetic basis of a wide range of conditions. By laying bare the human DNA code, scientists are creating a deep understanding of how our bodies work, an understanding that builds from the most basic level of genes.

A thorough understanding of the molecules of life promises to transform science and medicine: from molecules, scientists can better understand cells; from cells, researchers are understanding better how tissues and bodies work. The details are not easy to unravel, but researchers increasingly can trace how molecular alterations translate into physical symptoms. The HGP promises to yield insights about nearly all health problems and, ultimately, yield treatments for many conditions, whether inherited or not. Many, if not all, exceptional children will be affected by these discoveries, and some have already benefited. It is crucial that those affected by the discoveries should understand and appreciate what this project is about and how it will alter the medicine of the future.

THE GENETIC PERSPECTIVE

Genes are not everything, but they are very important. Genes are encoded within DNA, the molecule that transmits traits from parents to children. The genes that we inherit instruct our bodies in the steps necessary to build cells, tissues and organs, and how to break down food and use those breakdown products to build critical molecules to maintain health. Other genes make signaling molecules while still others make molecules that receive and process those signals. How all the components of life come together from a set of genes is like the creation of a symphony from sheet music—the creation of a harmonious whole from nothing more than spots of ink on pages of paper. Like music, the language of genes may appear simple, but in a living creature, the building blocks—or individual genes are woven together with beautiful intricacy to create a complex organism. Decoding the language or code of our genes will allow scientists to

continued on page 30



A chromosome test called FISH (fluorescent in situ hybridization) can highlight whether a child suspected of having velocardiofacial syndrome is missing a piece of chromosome 22 to confirm the diagnosis.

continued from page 29

understand in detail the enormously complex set of instructions that shape a human being.

To unravel the mystery of the code, scientists study both normal and abnormal genes. In this way, the importance of each gene can be defined and the consequences of gene dysfunction understood. An understanding of how each gene works can benefit us in many ways. Knowledge about normal and altered genes will assist diagnosis and treatment of a wide range of disorders. The Human Genome Project is the first step toward understanding the function of all of our genes and how those genes affect our health.

GENES AND ACCURATE DIAGNOSIS

Even before the function of a gene is understood, knowing that a particular gene somehow causes a particular disorder can be very useful. The knowledge can be used immediately to help with the problem of accurate diagnosis. Many medical diagnoses lump together ailments that actually represent a group of overlapping, but distinct diseases. For example, cerebral palsy and autism are diagnoses that each include a tangle of conditions that are probably distinct in origins and effects. When a diagnosis includes a mixed set of conditions, a child's diagnosis does not necessarily reveal much about what kind of future that individual child is likely to have, nor how that child should be treated to minimize symptoms. Refined and accurate diagnoses lead to prognoses that are more reliable and allow more informed decisions to be made about care.

HOW KNOWLEDGE OF GENES HELPS TREATMENT

For only a relatively small number of conditions do scientists understand the molecular abnormality at the root of the condition and how that abnormality causes the disorder. The HGP will supply the resources to help reveal the origins of nearly all disorders. The HGP has dramatically increased the rate at which human genes are being discovered. Little more than a decade ago, disease genes could be identified only if scientists already understood the biochemical problem they were facing, a prerequisite that left most disorders as unapproachable mysteries.

Now, scientific journals report the discovery of a new disease gene practically every week. The HGP helps scientists find disease genes based purely on genetic features like genes' positions in DNA, which means the basis of a disease can be discovered without any inkling in advance about the cause. The pace of discovery is accelerating. Ten years ago, the gene for cystic fibrosis was found after an arduous nine-year search. Eight years later, a gene for Parkinson's disease was found in only nine days.

Understanding pathogenesis—or how exactly a disorder arises—can reveal targets for intervention to prevent, mitigate, or reverse health problems. Finding a gene does not always lead to easy answers; for example, the molecular defect responsible for sickle cell anemia has been known since the 1950s, and medications can control some of the symptoms of this ailment. However, no one knows how to cure it. The gene for cystic fibrosis was discovered in 1989; ten years later, no treatments based on the discovery are yet on the market. However, understanding the genetic alteration in cystic fibrosis has fueled energetic attempts to design better drugs. Now, more than a dozen such drugs, based on an understanding of the protein encoded by the cystic fibrosis gene, are in clinical trials.

Sometimes finding a gene yields more immediate benefits. For example, the gene responsible for a form of inherited colon cancer called familial adenomatous polyposis, or FAP, was discovered in 1991. The gene, called APC, is often mutated in cases of sporadic colon cancer as well. But when a mutated APC gene runs in a family, even children and teenagers can be at risk for colon cancer. With the discovery of the gene, genetic testing became possible. In the case of colon cancer, cure rates are very good when tumors are caught and removed early. Genetic testing can reveal who is particularly susceptible and should embark upon a program of regular, close surveillance for colon polyps. Meanwhile, family members who find they do not have genes that put them at risk can confidently forego the screenings.

Genetics is also helping sort congenital heart defects, which affect nearly 1 percent of babies, into distinctive syndromes. One of these is velocardiofacial syndrome (VCF), caused by the absence or malfunction of a gene or group of genes on chromosome 22. Children with this disease often have cleft palate—but not all do—though they have the cardiac defect, which usually affects the aorta where it connects to the heart. A chromosome test called FISH (fluorescent in situ hybridization) can highlight whether a child suspected of having velocardiofacial syndrome is missing a piece of chromosome 22 to confirm the diagnosis. VCF is a good example of how a molecular test improves our understanding of a disorder. In the past, the syndrome was only thought to exist when a person had many manifestations (heart defect, cleft palate, and developmental delay). However, the availability of the molecular FISH test showed scientists that some people, including relatives of people with all the features of VCF, have only an isolated heart defect. This is a case where genetic tests have revealed that an underlying genetic alteration is more widespread than previously believed; not all people with a genetic alteration manifest traditional aspects of each syndrome. The genetic explication of these syndromes now means that children born into families where there is a history of these heart anomalies can be tested for a hidden genetic problem so the problems can be treated earlier. Also, the gene test can be used to diagnose children with unexplained heart anomalies; and if the VCF gene region deletion is the cause of the heart problem, that alerts caregivers to possible subtle developmental problems as well.

GENETIC COUNSELING

Genetic counseling is a process that includes risk assessment, education and psychosocial counseling. A precise understanding of the genetic basis for a health problem can help couples determine the risk that a disease will affect future children. If a disorder in one child apparently occurred by random chance, whether because of a rare new gene alteration in the affected child or because of an alteration during development not caused by genetics, parents can be reassured that the risk of recurrence in future children is small.

Congenital heart defects, for example, undoubtedly result from a combination of conditions, some resulting from alterations in a single gene, some from a group of genes acting together, and probably some non-genetic causes. In many disorders (e.g. congenital heart defect), the currently accepted statistics which represent the risk of recurrence, mix together many different conditions that arose for different reasons. No family wants to be counseled on the basis of a recurrence risk figure that reflects an average of these factors. Rather, they want a recurrence risk that accurately reflects their own situation so they can make family planning decisions that are right for their family.

Similarly, genetic counselors can best help families with their concerns when an accurate and specific diagnosis is available. Nearly all parents want a

continued from page 31

detailed and precise explanation of the cause of their child's problem. Generalizations are much less helpful. The ability to make an accurate diagnosis, provide a valid recurrence risk, and educate families paves the way for focused counseling on the challenges and issues that face the family. When an accurate diagnosis has not been made, much of the counseling process revolves around the issue of diagnostic ambiguity and the resulting frustration. When a specific diagnosis is made, counseling focuses more on coping with what is known about the disorder, dealing with the prognosis, considering reproductive decisions, and other related issues. In this way, genetic counselors can help families cope with the challenges they face and also help them deal with grief and loss.

THE FUTURE

The genetic underpinnings of many more conditions will become apparent in the coming years. The benefits of improved diagnosis and prognosis will spread to many more illnesses. However, achieving direct treatments and cures based on genetic research will take a great deal of scientific effort and time. Understanding in molecular detail the sequence of events that causes physical problems will yield insights on how to intervene in the disease pathway and interrupt it. In time, drugs will be designed to target specific gene products. Some drugs will interact with key proteins—whose place and time of action is understood—and perhaps adjust the level of action of genes.

Molecular genetics and the HGP are not the answer to all of these challenges. The completion of the HGP, expected by 2003, will herald the end of the beginning. That is, we soon will understand what causes most congenital and inherited disorders in human beings. It is a long road to the development of treatments and cures, but we have also traveled a long road from our former ignorance of the causes of these disorders. The HGP is allowing us to move forward with purpose and speed, and that should be a source of hope to all those who have been affected by these conditions. **EP**

Karin Jegalian, PhD, holds a Doctorate in Genetics from Massachusetts Institute of Technology and is a science writer at the NIH's National Human Genome Research Institute (NHGRI). Leslie Biesecker, MD, is an investigator at NHGRI focusing on the molecular and clinical characterization of multiple congenital anomaly syndromes and overgrowth syndromes. He is a board certified pediatrician and medical geneticist.

MEDICAL RESEARCH UPDATE 2000

For many of us, the new millenium holds great promise and opportunity—a chance for a "new beginning." Opening the door to the 21st century has freed our imaginations and bolstered our determination to embrace new aspirations, new discoveries, and new goals. The past year has given life to numerous treatments and research that hold equal promise. Starting this issue, we are going to provide medical research updates on a regular basis.

Compiled by Dave Chamalian

VISUAL IMPAIRMENTS

"Tunnel" Vision Now Possibile

After more than 30 years in development, researchers have developed an artificial vision system called the "Dobelle Eye," which will allow users to achieve some visual function in a "tunnel." The apparatus works as follows: A subminiature television camera and ultrasonic distance sensor are both mounted on a pair of special eyeglasses worn by the user. A miniature computer, mounted to the user's belt and connected to the eyeglases via a cable, processes video and distance signals, then activates a second microcomputer to transmit pulses to electrodes implanted on the surface of the brain's visual cortex. The first implant has been successful, as the user is able to navigate unfamiliar spaces, and is learning to watch TV and use a computer. Research has been done at the Dobelle Insitute in New York City in conjunction with its affiliates on Long Island and in Switzerland. For further information and to see a diagram of the Dobelle Eye, go to the following Web site: http://www.artificialvision.com.

ATTENTION DEFICIT HYPERACTIVITY DISORDER (ADHD)

Treatment and Insomnia

Research is now available that shows a link between the treatment of ADHD and insomnia. The authors of a new study suggest that children with ADHD—who, as a result of their disability, are prone to sleep disorders—who receive stimulants, experience a nearly two-fold rate of insomnia over children who do not receive treatment. The conclusion is that with the prevalence of ADHD (evident in three to five percent of the population) in our society and the common use of stimulant medications to treat it, it is important to monitor the sleeping patterns of children with ADHD before and during treatment to prevent exacerbating sleeping disorders. The Journal of Child and Adolescent Psychopharmacology has recently published this study.

Cautioning Early Diagnosis

An inordinately high number (nearly 60 percent) of small children—as young as 1 year old—are being diagnosed with ADHD and treated with Ritalin®, Prozac®, Zoloft®, and other psychotropic medications. A large percentage of these children have been found to have developed chronic health conditions such as asthma, diabetes, language disorders, and developmental delays. One researcher, MSU pediatrician Marsha Rappley, MD, is cautionary about these seemingly hasty diagnoses. "I don't think you can give a sample diagnosis of ADHD in a child of this age...My hypothesis about this is that the problems of these children are so severe that the physician and parents feel compelled to do something." The study was conducted at the University of Michigan and published in the *Archives of Pediatrics and Adolescent Medicine* .

AUTISM

Benefits of Early Diagnosis

Pauline Filipek, MD, professor of pediatrics and neurology at the University of California—Irvine, suggests in her new study the importance of early diagnosis of autism in children so that treatment can prevent the disease from becoming severely debilitating. According to the study, it is imperative that physicians be trained to spot the early signs of autism and carry out developmental screening of the disease on every well-child visit. "Our research found," says Dr. Filipek, "that children with autism are often not diagnosed until age 5 or 6 but have had symptoms of the disorder for years...We believe one reason for this is that the current practice of brief well-child visits does not provide enough time for primary care practitioners to screen for autism." The study recommends that besides physicians, early-childhood, health, and educational workers be trained to recognize the early signs of autism as well. The study is published in the December 1999 issue of the *Journal of Autism and Developmental Disorders*.

CYSTIC FIBROSIS

Ibuprofen Therapy

Michael W. Konstan, MD, has proved the benefits of a strict, long term ibuprofen regimen. In his extensive clinical study, people with CF (a hereditary pulmonary disease) who have taken high doses of ibuprofen over a four-year period show slower lung deterioration, better preservation of body weight, and fewer hospitalizations than those patients with CF who did not undergo ibuprofen treatment. Results are even better among those who underwent an eight-year, high dose ibuprofen regimen. In either case, Dr. Konstan's team deems it essential that any ibuprofen regimen be adhered to strictly and that it be carefully monitored. Dr. Konstan is the director of the LeRoy Mathews Cystic Fibrosis Center in Cleveland, OH.

Home vs. Hospital Care

Research shows that people with CF who are in the hospital under treatment for pulmonary exacerbation and have exhibited sufficient improvement in lung function benefit by being permitted to go home—provided there is someone to care for them—for the remainder of their IV antibiotics treatment. Individuals receiving treatment feel more comfortable at home, and they have their families around them to provide more balanced, nutritious meals.

Exercise and Nutrition

Clinical researchers stress the importance of regular exercise—including mobility and muscle-strengthening exercises and endurance training—for people with CF, regardless of pulmonary status. An exercise program, say the researchers, complements medical treatment in helping to clear pulmonary secretions. In addition, a diet rich in calories, to energize the muscles during exercise, and adequate fat, to prevent dependence on burning mostly carbohydrates during exercise, is essential. A combination of the proper diet and a regular exercise program will also serve to prevent osteoporosis, or the depletion of bone mass, a common problem found in adults with CF. This research was reported at the 13th Annual North American Cystic Fibrosis Conference.

A Financial Boost for Research and Development

The Bill and Melinda Gates Foundation has awarded a $20 million grant to the Cystic Fibrosis Foundation to be used for accelerating its drug discovery and development program. "One of the missions of [our] Foundation," says Mr. Gates, "is to support organizations that are not only doing something important to improve global health, but are also efficient at what they do." (When the CF Foundation was founded in 1955, most children did not live beyond school age. Today, the median age of survival is 32.) Says Robert J. Beall, PhD, and president and CEO of the CF Foundation, "The potential therapeutics already in the pipleline look very promising...What makes a gift of this magnitude so exciting is that it will allow us to exploit technology that will increase the volume in this pipeline exponentially..."

DOWN SYNDROME

Hearing Loss

Authors of a new study, Daniela Curti Thome, MD, Tanit Ganz Sanchez, MD, Ricardo Ferreira Bento, PhD, Maria Elisabete Bovino Pedalini, Elisa Maria Moreira Carcez, MD, and Mara Sarruf, have concluded that it is imperative for parents to recognize hearing-loss symptoms and ear discomfort in their children with Down syndrome. A disorder called secretory otitis media, inflammation of middle ear mucosa (often accompanied by excess fluid and secondary eustachian tube obstruction), is believed to be a leading cause of hearing loss in people with Down syndrome. Therefore, early detection of the warning signs of hearing impairment should be identified so that early treatment

On His Way To A Brighter Future

Michael is an inquisitive boy with mental retardation. His behavior kept him from making progress in public school. His frequent hitting, biting, and noncompliance pulled him further and further behind, and no one knew how to get him back on course.

When he came to Heartspring School at the age of 10, we started by getting to know him as an individual. His interdisciplinary team gathered data on his behavior in every situation, throughout the day. We documented causes and correlations.

Patterns began to emerge. Michaels toughest challenges, it turned out, lay in making transitions between tasks, so we provided him with structure and predictability. He was a boy of many hobbies, so we reinforced appropriate behaviors with rewards that reflected his personal interests. He had fallen into a cycle of frustration that tended to snowball out of control, so we taught him practical strategies dealing constructively with his anger.

Now, just over a year later, Michael is realizing a fuller potential. He's happier. His frequency of problem behaviors has dropped from 85 percent to nearly zero. He's returned to public school – and is once again moving forward with his life.

If you know a child who could use some help getting back on course, call Heartspring School.

can occur. This study was presented at the American Academy of Otolaryngology—Head and Neck Surgery Foundation Annual Meeting and Oto Expo in September 1999.

RARE DISEASES UPDATE

Neurotransmitter disorders: An underrecognized group of disorders

Research done by Keith Hyland, PhD (director of Neurochemistry Laboratory at the Kimberly H. Courtwright and Joseph W. Summers Institute of Metabolic Disease, Baylor University Medical Center, and K. Michael Gibson, PhD, SACMG, associate professor molecular and medical genetics and pediatrics, and director of Biochemical Genetics Laboratory, Oregon Health Science University Research), indicates that many children who are diagnosed with cerebral palsy, autism, seizure disorders, and mental retardation and other developmental delays may potentially have a disease of neurotransmitter metabolism. These diseases include: GTP Cyclohydrolase I Deficiency (dopa responsive dystonia) and Tyrosine Hydroxylase Deficiency (both currently treatable), Aromatic L Amino Acid Decarboxylase Deficiency, and Succinic Semialdehyde Dehydrogenase (SSADH) Deficiency. However, due to lack of information about and rarity of these diseases, the specific testing that exists for them is seldom done. The result is that many children may remain misdiagnosed and improperly treated. For further information, contact the Pediatric Neurotransmitters Disease Association at (516) 937-0049; or visit their Web sites at http://www.aladd.com and http://www.tndassoc.org.

MENTAL RETARDATION

Rett Syndrome Gene Identified

Fourteen years of research has yielded the location of the gene for Rett syndrome, one of the most common causes of mental retardation among girls. Uta Francke, MD, profess of genetics at Stanford University Schoo Medicine, and Mimi Wan, MD, PhD, also o the university, are coauthors of a study that reports the gene's location on the X chromosome. The gene takes part in halting the production of important—yet unidentified—proteins, which leads to the deterioration of the nervous system (a characteristic of the disease). The discovery of this gene makes early diagnoses possible and potentially provides doctors with the means to assuage or stall the effects of the disease in the child. This study is published in the October issue of *Nature Genetics*.

SICKLE CELL ANEMIA

Ultrasound to Detect Stroke Risk

Using sensitive new ultrasound equipment, doctors are now able to get a clear picture of the blood flow in the arteries of children with sickle cell anemia (an inherited, chronic blood disease), identifying abnormalities that may precede a stroke. With this technology, the narrowing of the arteries that occurs in the head (10 to 12 percent of children with sickle cell are at risk for this abnormality) is now easily recognized and can be treated more appropriately. Says Ab Malouf, Jr., MD, assistant professo radiology at the University of Mississ Medical Center, and head of the stu "Ultrasound with power Doppler is noninvasive, and it is much less expensive." **EP**

Editor's Note: Starting this month, EP will be publishing medical research updates on a continuous basis. This column will feature research sponsored by the National Institutes of Health, as well as those reported in medical journals. All material in this column will be thoroughly reviewed by our medical advisory board before publication i order that they may verify the integrity an validity of the research each study conta

With the spate of research coming fro the medical field and reported in the newspapers these days, it is difficult for the average person to decipher which studies are biased and which ones are genuinely reliable. To best serve our readers, we will make a systematic effort to go directly to the source of each piece of research we receive, and print only what we consider to be the most reliable. DC

Free Tranquility® Sample

Tranquility's **New** All-Through-the-Night (ATN) Disposable Briefs have extraordinary capacities—**now 50% more absorbent than before!**

- Your child can sleep all night uninterrupted by brief changes or leakage!
- The ATN Disposable Briefs feature a wetness indicator that blurs and then disappears after its been used.
- Kufguards®—lycra, multi-strand leg gathers—prevent leakage!
- Super Absorbent Peach Mat Protection Zone is guaranteed to keep your child's skin dry and eliminate odor.

HDIS (Home Delivery Incontinent Supplies Co., Inc.) carries a wide variety of products to meet your child's needs. Our home delivery service is the easiest, most convenient way to shop. Circle #41

DEFINING MEDICAL NECESSITY

Strategies for Promoting Access to Quality Care for Persons with Developmental Disabilities, Mental Retardation, and Other Special Health Care Needs

A report prepared by

Henry T. Ireys, PhD, Elizabeth Wehr, JD, and Robert E. Cooke, MD

WHAT IS THE PROBLEM?

In managed care plans, access to service depends in part on whether a service is found to be "medically necessary." Many existing definitions of medical necessity may lead to the denial of services required by special populations, including children, youth, and adults with developmental disabilities, mental retardation, serious emotional disorders, or other special health care needs. Most definitions lack critical components that will promote appropriate care for this population.

WHAT IS OUR GOAL?

The full Definition of Medical Necessity report (1) outlines a strategy for defining medical necessity that will promote high-quality care for children, youth, and adults with developmental disabilities, mental retardation, serious emotional disorders, or other special health care needs, and (2) included a draft definition that can be incorporated into legislation, regulation, or contracts. The report consolidates diverse components into a single statement with practical implications and presents a framework useful for analyzing definitions of medical necessity.

continued on page 48

Specifications for Defining Medical Necessity

1. A covered service or item is medically necessary if it will do, or is reasonably expected to do, one or more of the following:
    - Arrive at a correct medical diagnosis[1]
    - Prevent the onset of an illness, condition, injury, or disability (in the individual or in covered relatives, as appropriate)[2]
    - Reduce, correct, or ameliorate the physical, mental, developmental, or behavioral effects of an illness, condition, injury, or disability
    - Assist the individual to achieve or maintain sufficient functional capacity to perform at age-appropriate or developmentally appropriate daily activities

2. The managed care organization (MCO) or insurer must determine medical necessity on the basis of health information provided by the following persons: the individual (as appropriate to his or her age and communicative abilities), the individual's family, the primary care physician, and consultants with appropriate specialty training, as well as other providers, programs, multidisciplinary teams, educational institutions, or agencies that have evaluated the individual.

3. The determination of medical necessity must be made on an individual basis and must consider
    - The functional capacity of the person and those capacities that are appropriate for persons of the same age or developmental level
    - Available research findings, health care practice guidelines, and standards issued by professionally recognized organizations or government agencies

4. Final determinations will be made by a physician in concert with the following persons: the individual's primary care physician; a consultant with experience appropriate to the individual's age, disability, or chronic condition; and the individual and/or family.

5. Medically necessary services must be delivered in a setting (e.g., an individual's home, school, child care center, workplace, or community-based agency) that is appropriate to the specific health needs of the individual.

[1] Unspecified or undiagnosed conditions are common in this population; hence, additional or special diagnostic procedures or tests are frequently needed to reach a diagnosis that will assist in determining an appropriate care plan.

[2] Knowledge about the role of genetics in chronic disease and disability is growing rapidly. For example, diagnosis of fragile X syndrome in a child requires pedigree analysis and laboratory studies not only to permit accurate diagnosis, but also to ensure that genetic counseling is provided to help individuals and families make informed choices on reproductive issues.

continued from page 37

WHAT IS IN OUR REPORT?

Our report explains the rationale for a comprehensive approach to defining medical necessity. It illustrates the organizational context of medical necessity, and it distinguishes medical necessity from rationing. The report also outlines criteria for evaluating definitions of medical necessity:

1. The definition should incorporate appropriate outcomes within a developmental framework.

The Joseph P. Kennedy, Jr. Foundation Medical Necessity

The Joseph P. Kennedy, Jr. Foundation has for many years dedicated its resources to improving the lives of persons with mental retardation and other disabilities. Promoting access to their health care of high quality is one of the Foundation's most important goals.

Children and adults with mental retardation and other disabilities now are obtaining health services through MCOs. These institutions have the responsibility for identifying and supporting medically necessary health service. The definition of "medical necessity" serves an extraordinarily important purpose because it establishes the foundation for deciding what services each person will receive.

The Foundation wants to promote definitions of medical necessity that are sufficiently well-formulated and comprehensive to meet the health needs of persons with mental retardation and other disabilities. As MCOs and insurers seek innovative ways to meet the needs of all enrolled groups, model criteria for definitions of medical necessity are absolutely essential.

This report provides an exceptionally strong rationale for a comprehensive approach to defining necessity, as well as practical language that can apply to diverse purposes.

2. The definition should explicitly address the information needed in the decision-making process.

3. The definition should identify who will participate in the decision-making process

4. The definition should refer to specific standards.

5. The definition should support flexibility in the sites of service delivery

Based on guidance from a steering committee and a diverse expert panel, we developed specific wording for defining medical necessity. The report discusses the implications of implementing this approach.

WHO IS OUR AUDIENCE?

Vigorous dissemination efforts will ensure that this report reaches a broad range of

Now Your Child Can Wake Up Dry Every Morning!

With Tranquility disposable briefs, mornings can be easier for both you and your child, because Tranquility absorbs more urine without damaging tender skin. Rated number one by medical professionals, Tranquility is simply the best brief for your special child.

Tranquility's superior capacity means fewer changes and better skin all day long, too!

- Eliminates urine odor
- Latex-free
- Higher capacity
- Better skin protection

SUMMER CAMPS & PROGRAMS FOR CHILDREN WITH SPECIAL NEEDS

Children's Specialized Hospital offers a variety of summer camps and programs for children and adolescents with physical, developmental, and learning disabilities.

COMMUNI-KIDS:
A speech and recreation program for children with mild to moderate speech delays.

RAINBOW FISH:
Beginner instructional swim program for children with physical disabilities and/or developmental disabilities, PDD (autism) or AD/HD.

TEEN EXPEDITION:
A program for teens which will allow them to experience supervised, independent travel.

OUTDOOR ADVENTURES:
A week-long sleep away camp experience for children/adolescents with physical disabilities.

CAMPOREE/UNDER THE UMBRELLA:
Arts, crafts, sports, cooperative games, music, and special activities for children who have physical disabilities, PDD (autism) or AD/HD.

CAMP CHATTERBOX:
An overnight, intensive therapy camp for non-speaking children and adolescents who use augmentative and alternative communication systems and a training program for their parents.

MOVERS AND SHAKERS:
A sensory motor group program of occupational, physical, and speech therapy activities for children with developmental delays.

CHAT AND SNACK:
An oral motor, group program of exercises to strengthen and improve movements for talking and eating.

KUNG FU/KARATE:
Martial arts instruction for children with AD/HD, cerebral palsy, or any diagnosis causing gross motor or fine motor problems.

DEVELOPMENTAL DANCE:
A dance program for children with any diagnosis causing gross motor, fine motor, or social interaction delays.

READY, SET, SCHOOL:
A program to enhance pre-writing skills for children with fine motor difficulties.

PALS PARADISE:
Creative arts, drama, martial arts, and crafts for children with physical or developmental disabilities.

THERAPEUTIC HORSEBACK RIDING:
A program for children and adolescents with physical disabilities or movement dysfunction.

Adapting Toys For All Kids

by The Let's Play! Project

Toy features to look for as well as materials that can be used to make toys easier to play with

During the first years of life, the roles of children are characterized by play. They actively explore and interact with people and objects in their world. Mouthing, banging, touching, grasping, holding, rolling over, and clapping are just a few of the activities which furnish the child with information about the world. During the early years language emerges and play moves through stages, from exploration to using objects to pretend and mimic activities in the world.

Toys are the tools used by children during these developing years. However, many children are limited in the toys they can use. Often parents of children with disabilities are not sure which toys to choose. These parents tell us:

"I'm not sure what toys to buy. I can't just walk into a toy store and choose a toy; she can't play with just anything..."

"Our other children seemed to know what to do when they played. How can we get Anna to play?"

"We don't have much time for play; we have therapy to do and goals to work on"

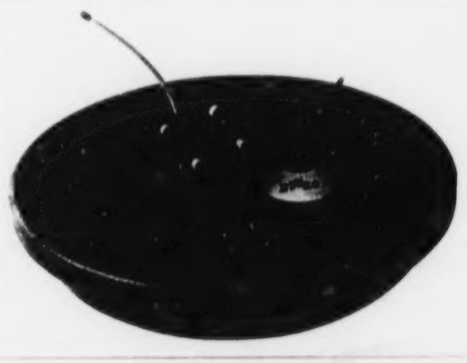
It makes sense to start where kids are successful- with toys that they like and can interact with. The Let's Play! Project Staff has found that two things must be considered in selecting toys for any child, :

1. What does the child like? What is she interested in?

2. How can the toy be used? What can the child do to play with it?

Remember, it is not the toy that is important, but how the child interacts with it. There are several adaptations that can be applied to make a toy more fun!

Austin is better able to play with this toy because it does not move away from him. Now he does not get frustrated while exploring the different buttons.



Suzie loved playing with the hippo that she controlled with a separate button controller—it was noisy and fun! But it moved so fast, she could not follow it. By putting the toy in a base, it stays where she can see it and still make it move!

Adapting Toys

As parents tell us they prefer to purchase toys from local stores, simple adaptations to the toys can make them easier for a child to use. These solutions include ways to extend, stabilize and make toys easier to use; the toy's accessible features and the abilities of the child will guide the modifications. The

Links can be used to "anchor" a toy to a tray so that it can not get "lost." The child simply pulls up on the links to retrieve the toy.

Toy Features

For the past decade, government mandates to ensure safe toys have lead to toys designed with simple features and easy access options. Buttons are larger, colorful plastics are used instead of metal, different textures abound, and sounds are often incorporated. The advent of the microchip has increased the availability of inexpensive toys that are highly reactive when touched—providing maximum enjoyment with minimal input.

When looking for toys, try them out before you buy. It is important to consider the features that will appeal to your child, how the toy is used and the physical construction of the toy. Listed below are specific elements to look for.

Sensory Characteristics: Many toys include several characteristics that may or may not be appealing to your child. Consider your child's preferences as well as your own. What a child likes may not be the same as his/her parent's. Some things to keep in mind are listed below:

Sound: Does the toy make sound? If so, is the sound potentially calming, or louder and potentially arousing? Can the sound be startling? Is the tone of the sound harmonic or brassy? Does it have a volume control? How long after activation does the sound continue?

Visual: Is the toy attractive? Is the color of the toy bright and/or is there high contrast between the colors? Are the color patterns simple or complex? Do the visual features invite touch? If the visual features are lights, how are they activated? How bright are they? Are they linked to sound? Can they be disconnected from sound?

Touch: What does the toy feel like? Is it soft, hard, smooth, rough, tickly, or cuddly? Is there vibration? Is the touch likely to be startling? Does the touch promote grasp? release? Does the feel of it encourage active exploration? If so, with the whole hand or with isolated finger movements?

Access Considerations: When a child is unable to interact with a toy, he or she may become frustrated or disinterested. Examine the toy to see how easy/hard it is to use.

How is the toy activated? Does activation require minimal movement, or more, on the part of the child? What movements are required? What body parts can activate the toy?

Where must the toy be positioned for activation? Can the position be changed to meet the needs of the child? Will the toy still "work"?

Does the toy have handles or knobs which the child must use? Are they of an appropriate shape and size for this child? If they are not, can they be easy adapted?

Are there multiple parts to the toy which need to be activated? Are these multiple parts inter-related in such a way that all must be activated to make the toy interesting? Alternatively, can multiple activation points be operated independently to provide variety?

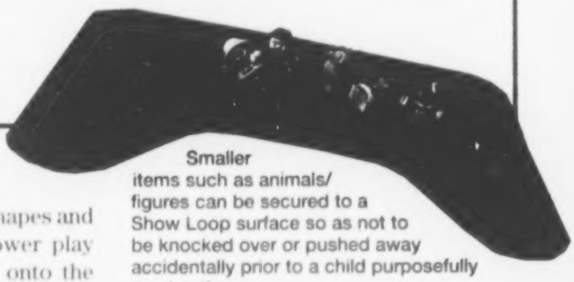
Physical Characteristics: Durability and safety should be incorporated into the design of the toy. Consider where your child will most likely use the toy.

Size: Small toys may in inaccessible to children with unrefined hand skills, or limited motor control; large toys may be inappropriate for placement on a lap tray, table or small bench. What are the physical characteristics of this toy? And where will the toy be used?

Construction: How is the toy put together? Is it stapled or glued? What is it made of? These factors may influence the safety, weight or durability of the toy/device.

Stable: Is the toy stable by itself? Does it require one hand to stabilize it while the other hand manipulates it?

Versatile: Does the toy provide some variety in and of itself that may promote use of the toy in more advanced ways as the child develops skills?



Smaller items such as animals/ figures can be secured to a Show Loop surface so as not to be knocked over or pushed away accidentally prior to a child purposefully moving them.

Tyler's shopping cart helps him to walk "all by himself" when Velcro™ is applied to each wheel. It adheres to the loop carpet to slow his cart down. This makes walking feel safer and more fun to him. His dad plans on removing the Velcro™ wheel-by-wheel as Tyler begins to walk better!

following are examples of toy positioning and access aids.

- Links come in a variety of shapes and sizes and can be used to lower play materials from an overhead onto the child's body for initial "connection."

Sometimes children are so intrigued by the links themselves that they never get to the toy at the end! Assuming that the toy is more interesting than the links, try using or inch elastic for a pulling effect, shoelaces (straight or curly), or snap straps (in sewing stores for toddler pants).

Stabilizers are materials that support play by preventing an item from moving out of the child's visual or physical reach.

continued on page 42

adapting toys for all kids

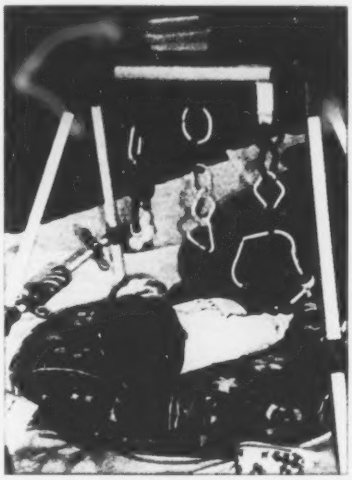
continued from page 41

Often toys need less adaptation if they can stay "in one place".

Non-slip materials: are readily available which prevent an object from moving out of reach. Materials such as dycem (from professional catalogs) or grip liner. "mug mats" and other kitchen products can be used.

Velcro™: Small strips of (male/hook) Velcro™ can be placed on the base of a toy to hold a toy firmly in place. It adheres to a matching (female/loop) Velcro™ strip on the table surface where it can be played with.

Show Loop is a fabric which acts as "female velcro". When glued to a play surface (tray, table top, etc.), objects will firmly adhere to it when "male velcro" is placed on the bottom of the object. For example, by putting strips of male Velcro™ on the base of a puzzle, the child can more easily use the pieces, as the puzzle is stationary.



Attachers are materials that are used to bring items closer to the child, making reaching, grasping and playing less "work." Families frequently use attachers with an overhead gym to make play easier. Several items are available for use.

If you need a playing surface for stabilizing objects, bed trays can be used as floor tables and covered with Show Loop.

- Carpet squares (indoor/outdoor) provide some stability and also work with male Velcro™, but objects do not adhere as strongly as with Show Loop.
- Dual Lock is another material that is stronger than Velcro™, but not as easily removed.

Velcro can also be placed on other toys/objects to promote stability.

- Built-Up Extenders: Building up or extending existing parts on toys is another method of adaptation that can lead to more successful use.
- Cylindrical foam padding comes in a variety of colors and widths and is a "quick-fix" to make crayons, markers, spoons and musical instruments easier to use. Sponge rollers can often be used in the same way.
- Large knobs can be found in hardware

The portable word-processing keyboard used by schools and therapists to assist students with physical and mental learning disabilities including: Dyslexia, Dysgraphia, Autism, ADD and muscle coordination problems.

The AlphaSmart 3000

Features:

- Full-size keyboard with a four-line text display
- Weighs only two pounds
- Runs 200-500 hours (an entire semester) on 3 AA batteries
- 100 pages of text
- Built-in 70,000 word spell checker
- Patented one-key Send, AutoSave, Auto PowerOff, Password Protection and Find Features
- Keyboarding timer for typing assessment
- Rugged (engineered to withstand handling by children)
- Includes features for individuals with special needs (sticky keys, key repeat control and four keyboard layouts, QWERTY, left hand only, right hand only and Dvorak.)
- No special software required to transfer text to a PC/Mac
- Optional Get Utility software allows data transfer from PC/Mac to the AlphaSmart 3000
- Unlimited toll-free support.
- Install applets to extend functionality

Compatibility:

- Works with virtually any PC or Macintosh running any application
- PC: PC's running DOS, Windows, Windows95, WindowsNT, or OS/2 (NOT compatible with Older XT model PC's)
- Macintosh: Any Apple with an Apple desktop Bus (ADB) interface, running System 6.x or later. (NOT compatible with Apple IIe, Mac Plus, Mac 512)
- Laptop computers allowing an external keyboard.
- Prints directly to most printers (requires optional cable or printer with infrared lens).

stores to replace smaller ones. This can be particularly helpful for puzzle adaptations. Popsicle sticks or tongue depressors can be glued onto piano keys to provide easier access.

- Confinement Materials: Some toys or pieces to toys have a tendency to "move away" from a child. To keep the toys in visual and/or physical reach, use items such as hula-hoops, box tops or planter bases. This also helps a child to control his immediate play environment.

[illegible]

Often the use of one or several of these simple adaptations to a well-selected toy provides new and unique opportunities for play by children with disabilities. Go to the Let's Play! web site for more ideas. (http://cosmos.ot.buffalo.edu/letsplay/) **EP**

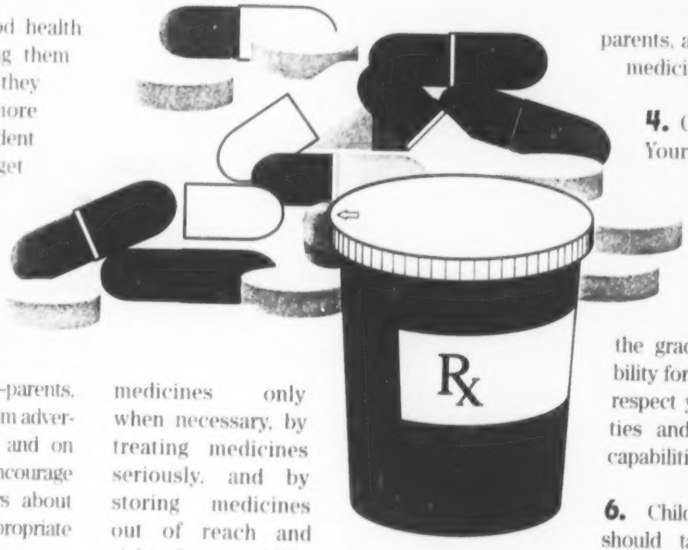
Help Your Children understand their medicines

Teaching your children good health practices includes teaching them about medicines. The more they know about medicines the more prepared they are for independent and responsible use as they get older. Children need to know about how medicines work in the body.



What do children want to know?

Children need to learn about medicines from trusted sources—parents, physicians, or teachers instead of from advertisements in stores, publications, and on television. As a parent, you can encourage your children to ask the doctors about medicines and help them prepare appropriate questions. For example:

- What will my medicine taste like?
- How will it make me feel better?
- Will it be pills, liquid, or shots?
- When do I have to take it?
- How long do I have to take it?
- Does it have side effects?
- Why do I have to take it?

What you should teach your children to do:

- Take the right medicine, at the right time, in the right amount—read the directions with your child.
- Take all of the medicine prescribed even if your child feels better. This is especially important when taking antibiotics.
- Encourage your child to tell you about any unexpected side effects or reactions so you can call a healthcare professional.

Participate in health education activities that teach the principles of responsible use of medicine.

Parents and caregivers

Most of all, as a parent, set an example of proper and safe medicine use by taking medicines only when necessary, by treating medicines seriously, and by storing medicines out of reach and sight of young children.

Ten principles for teaching your children and adolescents about medicines

These principles are intended to encourage activities that will help your children through adolescence, become active participants in the process of using medicines * to the best of their abilities. These principles do not specify children's age, as children of the same age vary in level of development, experience, and capabilities.

1. Children, as users of medicine, have a right to appropriate information that reflects their health status, capabilities and culture.

2. Children want to know. Healthcare providers and health educators should communicate directly with children about their medicines.

3. Children's interest in medicines should be encouraged. Show them how to ask questions of healthcare providers, parents, and other caregivers about medicines and other therapies.

4. Children learn by example. Your actions should show children appropriate use of medicines.

5. You, your children and your healthcare providers should negotiate the gradual transfer of responsibility for medicine use in ways that respect your parental responsibilities and health status and the capabilities of your child.

6. Children's medicine education should take into account what children want to know as well as what health professionals think children should know.

7. Children should receive basic information about medicines and their proper use as a part of school health education.

8. Children's education about medicine should include information about their general use and misuse, as well as about the specific medicines the child is using.

9. Children have a right to information that will enable them to avoid poisoning through misuse of medicines.

10. Children asked to participate in clinical trials (after your consent) have a right to receive appropriate information to promote their understanding before assent and participation.

Adapted from U.S. Pharmacopoeia's Guide to Educating Children About Medicine.

An Introduction to State Title V Programs for Children with Special Healthcare Needs

WHAT IS TITLE V AND HOW CAN IT HELP YOU?

by John Reiss, PhD

Every state and the District of Columbia has a Title V Program for Children with Special Health Care Needs (CSHCN) that is funded, in part, through the Federal Title V Maternal and Child Health Block Grant, and provides health and support services to children with special needs and their families.

These programs began in 1935, when Congress passed the Social Security Act, a law designed to bring some financial and health security into the lives of America's most vulnerable citizens. The fifth article of that act, known as Title V, provided funds to states to develop and operate public healthcare programs for certain children with special healthcare needs, as well as to establish other programs to promote the health of mothers and children with low income.

In the 1930s through the 1970s, most of the state programs that were funded through Title V of the Social Security Act were called Crippled Children's Services (CCS) Programs and focused their efforts on identifying "crippled" children and providing services for the diagnosis, treatment, and ongoing care of "crippled" children. Children initially served through these programs were limited to those with orthopedic problems. In the 1960s, 1970s and 1980s there was a gradual expansion of these programs in many states, and state Title V CCS Programs began to provide health and related services to children with other serious chronic health conditions and physical disabilities, such as cerebral palsy, heart problems, hearing problems, spina bifida, cystic fibrosis, etc. In the late 1970s, Congress funded state CCS Programs, through Title V, to provide case management and care coordination services to children under the age of 16 who received benefits through the Supplemental Security Income (SSI) Program.

As a result of the expansion of the eligibility criteria of state CCS Programs, services for more children with chronic illnesses, developmental disabilities, sensory impairments, and other special health needs were being provided. In recognition of this expanding responsibility and in response to criticism that the term "crippled children" was stigmatizing, Congress changed the name of its program in the Title V statute to State Programs for Children with Special Health Care Needs (CSHCN). In response to this change in federal legislation, all states' Title V Programs have deleted the phrase "crippled children" from their names. However, because the legislation did not mandate that states use a specific name, Title V CSHCN Programs are known by different names in different states. Names given to CSHCN Programs include: "Children's Medical Services;" "Children's Special Healthcare Services;" "Child Health Specialty Clinics;" and "Division of Specialized Care for Children."

The federal Title V legislation also gives states the flexibility to use their Title V funds to design and implement direct care programs and services that are responsive to the specific needs of CSHCN and their families in the state, and accommodate the strengths and limits of the child health infrastructure in the state. Therefore, state Title V CSHCN Programs have different financial eligibility criteria, serve different populations of children and youths with special healthcare needs, and provide and/or fund different sets of

> **Over the last ten years, the Maternal and Child Health Bureau, at the Federal level, in partnership with state Title V CSHCN Programs, family leaders, and other professional and advocacy organizations have focused a significant level of effort on defining, describing, and making family-centered, community-based care available to all CSHCN and their families.**

healthcare and related services. This can be confusing for a family with a child who has special health needs, when moving from one state to another.

Because of the significant differences among state Title V CSHCN Programs, the Maternal and Child Health Bureau has supported the development of the "Directory of State Title V CSHCN Programs: Eligibility Criteria and Scope of Services" through a grant to the Institute for Child Health Policy at the University of Florida. The information contained in this report is available through the Internet. The address on the World Wide Web is http://www.ichp.edu.

In addition to providing direct, personal healthcare services to eligible children, state Title V Programs also have a responsibility to improve the quality and responsiveness of the overall healthcare system for children with special healthcare needs. States were given this "systems development" responsibility in 1989, when Congress amended Title V of the Social Security Act, and required that state CSHCN Programs "provide and promote family-centered, community-based, coordinated care (including care coordination services...) and facilitate the development of community-based systems of services for such children and their families."

The 1989 amendments also allowed state Title V Programs to continue to use federal funding to provide rehabilitation services to children under the age of 16 who receive benefits through the SSI Program.

Over the last ten years, the Maternal and Child Health Bureau, at the federal level, in partnership with state Title V CSHCN Programs, family leaders, and other professional and advocacy

organizations, has focused a significant level of effort on defining, describing, and making family-centered, community-based care available to all CSHCN and their families.

Family-centered care is a process that focuses on ensuring that:

- the organization and delivery of healthcare services meet the emotional, social, and developmental needs of children:
- the families of CSHCN are integrated into all aspects of the healthcare plan:
- families have alternatives and choices based on their own needs and strengths, and receive support for those choices:
- the healthcare system facilitates family/professional collaboration at all levels, especially in planning, implementing, and evaluating programs and their related policies and practices.

To accomplish this, state Title V CSHCN Programs have worked to develop meaningful partnerships with families and promote leadership by families.

State programs also provide the training, guidance, and policies that create these partnerships within each community as it builds its systems and services. Thus, the activities of state Title V CSHCN Programs are not limited to providing and paying for healthcare for eligible children.

Rather, these programs also fund family-to-family support organizations and help families in their effort to play an active role in the development of programs and policies that are of benefit to all children with special needs and their families.

Rather, these programs also fund family-to-family support organizations and help families in their effort to play an active role in the development of programs and policies that are of benefit to all children with special needs and their families. **EP**

John Reiss, PhD, is the Director of Policy and Program Affairs at the Institute for Child Health Policy (ICHP), University of Florida, Gainesville, FL. For a listing of Title V Programs by state, see the Exceptional Parent 2000 Resource Guide or log on to the ICHP Web site: http://www. ichp.edu.

FEROLETO Children's Development Center

St. Vincent's Special Needs Services

Providing private special education alternatives to Fairfield and New Haven County families since 1960

Preschool Programs for the Child, age 3 to 5, with:

- Mild to Profound Developmental Delays
- Sensory and Communication Delays
- Hearing Impairments

School Program for the Child, age 3 to 21, with:

- Multiple Developmental and/or Medical Needs including Acquired Brain Injury

We Offer All Students:

- Small Classes w/210 Day Calendar
- Individualized Instruction
- Inclusive or Self-Contained Classes
- Individual and Integrated PT, OT and Speech Therapies
- On-site Nursing Services and Speciality Medical Clinics
- Assistive Technology
- Customized Adapted Equipment
- Augmentative Communication
- Fully Air-Conditioned Building
- Indoor/Outdoor Recreation Areas
- Transition Planning Services for All Ages and Development Stages

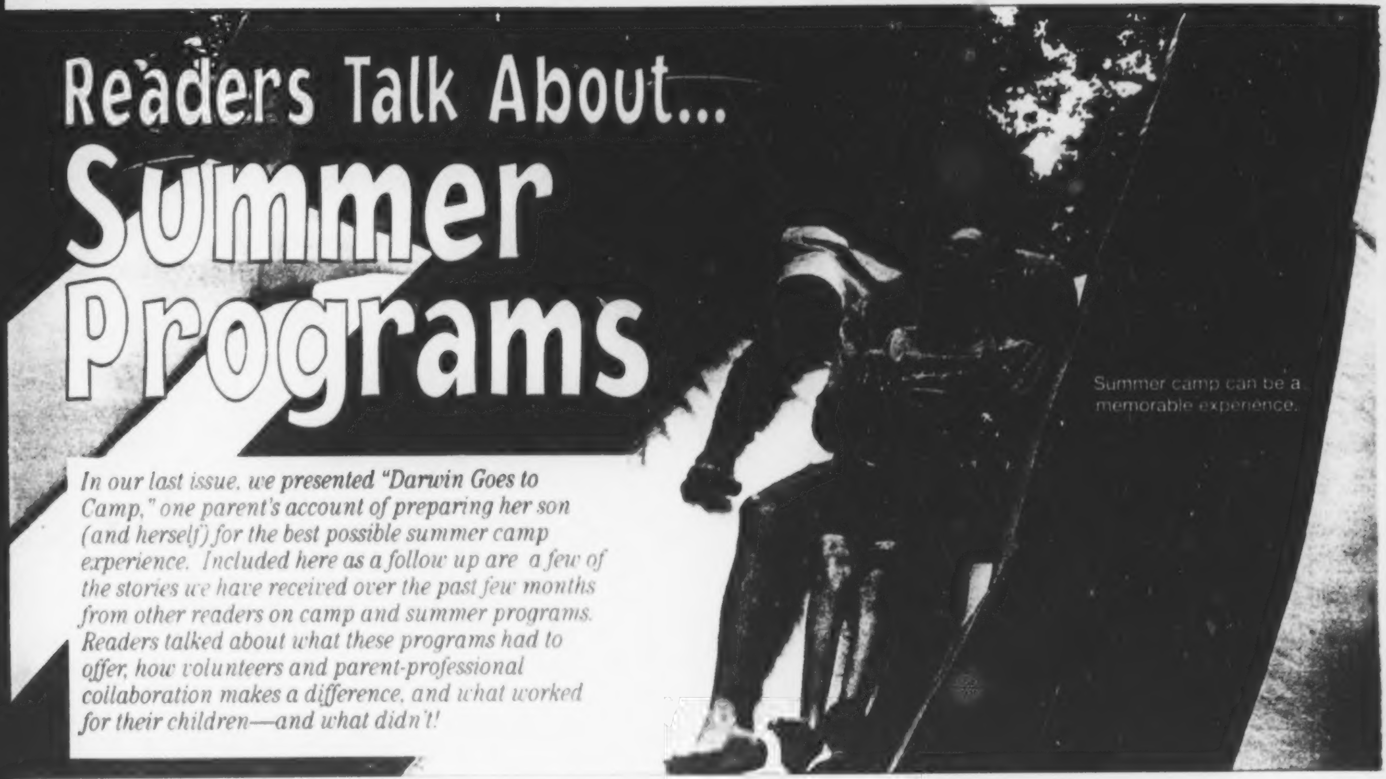
Readers Talk About... Summer Programs



Summer camp can be a memorable experience.

In our last issue, we presented "Darwin Goes to Camp," one parent's account of preparing her son (and herself) for the best possible summer camp experience. Included here as a follow up are a few of the stories we have received over the past few months from other readers on camp and summer programs. Readers talked about what these programs had to offer, how volunteers and parent-professional collaboration makes a difference, and what worked for their children—and what didn't!

To Summer Camp or Not... That Is the Question

by Jamie Sowers

With ten years experience as a parent of a daughter, Rebecca, who has cerebral palsy, I realized a few years ago that it is all right to need a break. I also have a little boy, Ryan, who is three years younger than Rebecca. I sometimes need a break from him, too!

I looked into camps that could suit both of my children's needs. I am a firm believer in inclusion and mainstreaming in the schools, so why not in a camp? The camp I found had just that: programs for a younger child and programs for a child in a wheelchair. The camp had sent us information through our school, and would even provide transportation for a nominal fee if we needed. It had a lot to offer, so I called and was allowed a tour of the facilities. I also asked if they would have a problem if I stayed for three days. I didn't bother anyone and stayed out of the way of the campers, volunteers and counselors, but I had to make sure everyone was taken care of.

The camp was wonderful—accessible, lively, many activities to do, wonderful people (campers and counselors and volunteers), all the things you could want in a camp. At the time, Rebecca was being catheterized four times daily and that was a major issue for me; however, there was a nurse on staff who could accommodate that. Then there was the feeding issue. I made sure I packed a lunch that would be easy for a new person to feed her. Most of the volunteers were teenagers with no previous experience handling or feeding people with special needs, and Rebecca was assigned a different person every day. I watched a 14-year-old boy try to feed Rebecca. He was getting frustrated, and so was she. I wound up feeding her lunch.

Another problem was the fact that most of the campers with disabilities were in wheelchairs. Ever sit in a wheelchair in 90 degree weather with that black, no-breathing leather underneath you for six hours? Well, these kids did. They were taken out of their chairs only once to go swimming. That job (transferring kids in and out of their chairs to get bathing suits on and off) is a major task toundertake. So again, I watched, thinking that this was not working out.

I went and looked in on Ryan. He seemed to be having a great time, and although Rebecca looked like she was enjoying some of the activities (she enjoyed the arts and crafts, swimming, and socializing the most), it was very draining for her to be out in the heat all day long.

I am a great believer in having options, so I tried to think about what options were available and what would work best for us. How would Rebecca (and I) be able to enjoy camp without all the hassle? After three days, I realized that Rebecca should go for half days, after lunch...that way she would

Positive Lifestyles

for people with developmental disabilities

Lifestyles mean opportunities for growth.

Lifestyles mean living with friends and people who care about you.

Lifestyles mean being a valued member of the community, an active participant in community activities, and using its resources freely.

Martha Lloyd Community Services is all about *Lifestyles* and community. For more than 70 years, it has provided the highest quality residential and vocational services. The rural village of Troy, in northeastern Pennsylvania, offers a variety of shops, restaurants, and churches all within easy walking distance. The feeling of being valued community members is affirmed as residents join local bowling leagues, participate in community activities, do their shop-ping in local stores, and meet friends at the village pizza shop. Our programs are uniquely designed to accommodate individual needs from supported living to highly structured situations and include a program for mature women.

- Life skills training
- Vocational training and employment opportunities at Martha Lloyd and in the Troy community
- Caring professional staff experienced in working with developmental disabilities
- Our interdisciplinary team approach assures continuity and consistency in individual planning
- Low staff turnover
- Unique leisure and recreational experiences in a rural community setting
- Excellent health care provided by on-site health professionals and a community health center
- Annual fees are among the lowest in the nation

Summer camp counselors are dedicated to making the camp experience both educational and fun.

continued from page 49

already have had lunch, been cath'd, had plenty to drink, plenty of down time, and be ready for a few hours of fun. That worked perfectly. So, we tried it that way and we liked it.

The Broome-Tioga BOCES Integrated Summer School Program

by Carla Simpson, MSW, CSW

Children with autism and other severe developmental disorders need ongoing therapy and education to maintain their skills. Communication and social skills are particularly susceptible to regression. So, how do we help these children maintain their skills over the summer? Summer camp. Well, actually an inclusive summer school program run at summer camp sites, integrating these students with their non-disabled camping peers.

Spearheaded by parents from the local Autism Society of America, the Broome-Tioga BOCES started an Autism Task Force comprising administrators, education staff, and social workers. The task force worked on ways to improve educational programs for students with autism in the BOCES districts. The task force created a new, totally integrated summer program for autistic and multiply disabled students.

Community camp sites included the Jewish Community Center, Binghamton YMCA Summer in the City Program, Heritage Country Club, and Great Beginnings Child Care Center. The students, their teachers, and aides joined in all of the camp activities, including swimming, sports, crafts, and field trips. Many of these activities were challenging for the students with disabilities, some of whom had sensory integration or mobility problems. Each student, however, was able to participate in the activities at his/her own level. Individual Education Plan objectives included communication, social skills, adapted switch use and other skills, depending on the student's needs and level of accomplishment.

Campers at Extra Special People, Inc., are always busy. Here they take a rare break to pose for a group shot.

Sometimes, the Campers Make the Camp!

by Susan Colburn

Every summer, members of our church take about 150 fourth- to sixth-graders camping for a week. Shocco Springs Camp in Talladega, AL, is a huge facility, built on a hill.

This summer, for the first time, my son, Ryan, and one of his friends, also named Ryan, went along on the trip. Unfortunately, the camp was not accessible at all. This was a challenge, because both boys use wheelchairs. Thanks to the great attitude of all the adults and children involved, the issue of accessibility became a non-issue. The theme for the camping trip that year was "Teamwork." What better way to demonstrate the meaning of teamwork than by coming together to help others have the best time possible? All of the other campers made sure the two Ryans were part of every activity. Both boys slept in a cabin with 14 other boys, and participated in all activities, from swimming and canoeing, to arts and crafts, and, of course, the annual watergun fight! They even received love letters, which were read aloud at lunchtime!

I had visited the camp beforehand and had grave misgivings about Ryan going on the trip. I felt anxious, but Ryan really wanted to go, so I let him. It turned out be a lot of fun for everyone.

This experience has certainly changed the way that the children who went on the trip see people with disabilities. It has also opened up a whole world for my son. He is very proud of his accomplishments while camping, and had a great time. As a parent, I think it has made him more outgoing, self confident, and it did so much for his self-esteem. He is eagerly awaiting his next opportunity to go on a church trip!

Jamie Sowers writes that it is all right to need a break from caring for her daughter Rebecca (front) and son Ryan.

Both the BOCES and camp staffs were trained in issues surrounding autism and related disorders by parents from the Autism Society of America. A school nurse participated, even going on field trips, so that students who were tube fed could be fully included. This program was unlike any other program in New York State in its use of existing camp programs for integrated education sites. It was well received both by parents and the community.

Broome-Tioga BOCES has made a real commitment to working with parents to find the best options for educating their children. This inclusive program is an example of parent-educator collaboration at its best.

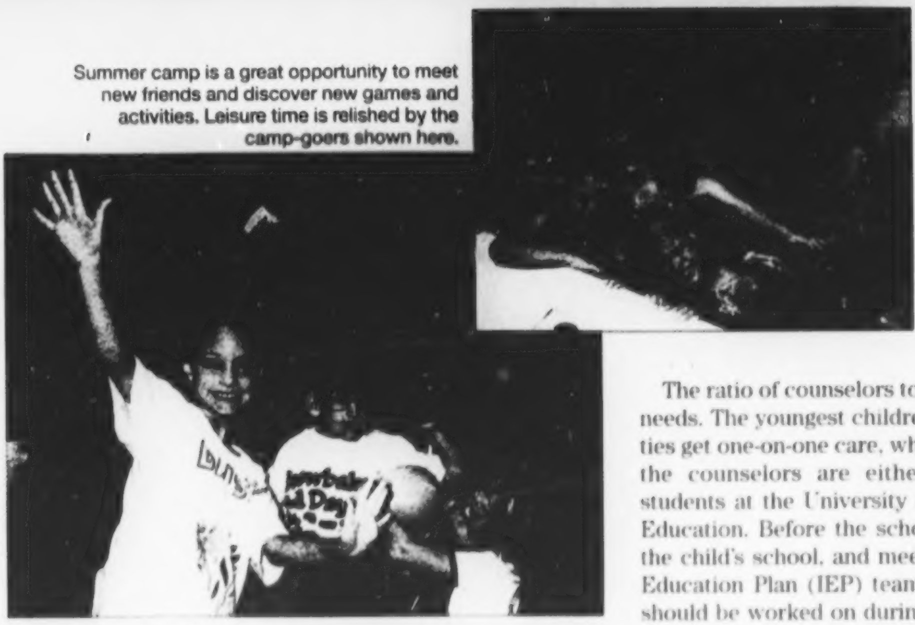
An Extra Special Camp

by Carol Brooks

My son Craig is 13 years old, visually impaired, and has a seizure disorder, severe developmental delays, and an oral-motor dysfunction that affects his eating and swallowing.

When Craig was 7 years old, I had come home from the birth of my daughter, and was feeling overwhelmed. I asked the state about a summer program Craig could attend. The state offered to pay tuition for a county-run program at a state recreational facility. He would have been in a group of about 10 other children. Nearby, however, was a program called ESP (Extra Special People), Inc., that offers leisure activities for children with disabilities ages four through adult. They seemed to have more to offer, so I enrolled

continued on page 52



Summer camp is a great opportunity to meet new friends and discover new games and activities. Leisure time is relished by the camp-goers shown here.

continued from page 51

Craig. He has been going to ESP ever since.

Although ESP has programs throughout the year, the summer program runs for about eight weeks, five days a week, from 9:00 a.m. to 3:30 p.m.--for $40 a week!

ESP features bowling, visits to the community library, school bus service, and access to all local parks, including a nature center and a lake. Summers in Georgia get hot, and the campers get to swim every day. The camp offers a very structured routine, including art, sports, music, games, and leisure play on a playscape with swings. The campers are always busy doing something fun!

The ratio of counselors to campers depends on the child's needs. The youngest children, or those with severe disabilities get one-on-one care, which is what Craig needs. Most of the counselors are either graduate or undergraduate students at the University of Georgia, majoring in Special Education. Before the school year ends, counselors go to the child's school, and meet with his or her Individualized Education Plan (IEP) team, to see if there are areas that should be worked on during the summer, to carry over the IEP until school starts again.

ESP is funded through community donations, and holds fundraisers throughout the year, sponsored by local businesses, churches, and major corporations.

The best thing about ESP is actually feeling good about dropping my child off for the day. I have total confidence that he is safe, loved, and having a great time. What more could any parent ask? **EP**

UNITED CEREBRAL PALSY (UCP)

Understanding Disabilities
Creating Opportunities

s the tenth anniversary of the passage of the Americans with Disabilities Act approaches and the world begins life in the twenty-first century, now is a good time to reflect on the powerful, positive changes that have occurred in the world of disability. These fundamental changes and advances in such areas as technology, barrier-free architecture, employment, and education have contributed to the goal of full inclusion of children and adults with disabilities in all aspects of the community. Over the years, one organization that has been a tireless advocate, innovative service provider, and powerful visionary in their quest to fulfill their mission of advancing the independence, productivity, and full citizenship of people with disabilities is the United Cerebral Palsy (UCP).

A proud history

The group was founded in 1949, when a group of parents of children with cerebral palsy banded together in New York City to find ways to provide a better life for their children.

This small group of parents, headed by Leonard Goldenson, founder of the American Broadcasting Company, and his wife, Isabelle, Jack Hausman and his wife, Ethel, and Nina Eaton, has grown into a powerful national organization. Today, UCP is a nationwide network of more than 140 state and local voluntary agencies (UCP affiliates) which provides programs and services and conducts public and professional education programs relevant to children and adults with cerebral palsy and other disabilities. "We started out just wanting a better life and chance for our children. It is amazing to see how far our effort has come. In those days, we were the only voice for our children and it is incredible now to see children with disabilities develop their own voice" says Nina Eaton, UCP co-founder and current national board member.

What UCP can do

Direct services provided by UCP affiliates include:

- physical and occupational therapy;
- assistive technology;
- information and referral;
- early intervention;
- employment skills training;
- individual and family support;
- social and recreation programs;
- community inclusion and independent living;
- advocacy and community education.

These programs and services support people with disabilities as they strive to reach their full potential and become full, productive members in their local communities.

Looking ahead

In April, UCP began a year-long, fiftieth anniversary commemoration which celebrates the rich history of the organization with an eye toward further growth and success in the future. As part of UCP's "eye toward the future," the organization is preparing for the launch of a new and dynamic public education campaign featuring a new Web site as well as radio, print, and television advertising which captures the essence of the agency's commitment to people first.

An integral component of the new public education campaign is the debut of a new, contemporary UCP logo (which appears on this page) and tagline "Understanding Disabilities, Creating Opportunities." This universal tagline and theme resonates throughout UCP as an organization, and especially with the people and families they serve. "UCP is about making a difference in the lives of children and adults with disabilities with cutting-edge, innovative programs one person at a time," says UCP National Volunteer President, Charles Moses III, Esq.

UCP on the Web

The innovative programs at the local level are only a small sampling of what is happening at UCP. In an effort to provide the latest information on a wide variety of happenings in the disability field, from new medical therapies, to important legislative information, to activities in each state, UCP has built a new, fully accessible

continued on page 54

> **"UCP is about making a difference in the lives of children and adults with disabilities with cutting-edge, innovative programs, one person at a time."**

continued from page 53

comprehensive Internet Web site.

This Web site provides information on national issues important to the disability community, as well as information and connections to local UCP affiliates across the nation. This new format allows every Web visitor the chance to find out the programs and services available in their local area, how to become involved in the program, as well as how to help the affiliate make a difference. "We are committed to being the preeminent information source for and about the disability community, and the Web gives us another important resource tool to fulfill that commitment" states UCP National Executive Director Kirsten A. Nyrop.

UCP has prided itself on two decades of sponsorship relationships with major corporations such as Tosco Circle K, Miller Brewing Company, Health South and TCBY. UCP was pleased to announce this year two new corporate sponsors—First USA and QVC. UCP will launch its own affinity card program first quarter 2000. Also, first time shoppers who shop on QVC and mention "UCP sent me" will drive additional revenue back into UCP. This is an exciting time for UCP. **EP**

To learn more about UCP, visit their Web site at http://www.ucp.org, or call (800) 872-5827.

Serving over one million Americans a year with cerebral palsy and other disabilities, UCP is the largest non-profit healthcare organization in the United States. UCP is also one of America's most financially responsible charities, with 85 percent of revenues being devoted to programs and services for individuals and their families through affiliates in 40 states.

ROLE MODELS

The Best Offense is a Good Defense

Jay Leeuwenburg, speaks to children about coping with diabetes. He hopes that his positive message reaches children and young adults and motivates them to live life to the fullest.

by Kerry Pianoforte

n football, offensive linemen form the "brick wall" that protects the quarterback from the onslaught of the opposing team's defense. On the playing field, Jay Leeuwenburg, the 6'3", 290 lb. offensive lineman for the Cincinnati Bengals, stands his ground. Off the field, Jay Leeuwenburg does not let anything, especially his diabetes, stand in the way of his dreams. Jay was diagnosed at the age of 12 with Type 1, or "juvenile," diabetes. This lifelong condition, which affects more than one million Americans, can occur at any age, but is most commonly diagnosed in childhood. In Type 1 diabetes, the pancreas produces little or no life-sustaining insulin. People with this condition must take several insulin injections a day for the rest of the their lives. Before being diagnosed with juvenile diabetes, Jay had some of the classic symptoms such as an unquenchable thirst, frequent urination, and lethargy. The diagnosis was a shock for Jay and his family because there was no family history of the disease. He felt relief, however, upon receiving a diagnosis and proper treatment. He recalls, "I think I felt so bad from having been undiagnosed that as soon as I got my first shot of insulin I felt so much better."

[illegible]

Jay credits his parent's approach to his illness with helping him enjoy a happy childhood. "They did a great job of making ours a 'diabetic' family." Jay explains that as a family they all kept to the carefully balanced diet that he required to help keep his disease under control. "I have an older brother and never did I feel that because I have diabetes I missed out on something." Jay feels that this "team" approach to diabetes is important because, "children hate to feel different, they hate to feel alienated, and it is important to make them feel like they are still as normal as possible. People have to realize, particularly as a child, if you are going to a birthday party you're going to have cake and ice cream because it is important for you to fit in. You have to compensate by having less pizza, and you may have to take more insulin." This team approach is something Jay still practices at his home with wife Ingher and their two young daughters. "If I know that I'm going out and having dessert, I'll take some more insulin. As long as you have a little forethought and you actually think about what you're doing rather than doing whatever you want, you can reach a balance. I don't think it's dependent on whether you're diabetic or not, I think it's fairly good practice for everyone."

[illegible]

Throughout his life, Jay has defied the odds with his "can do" attitude. Jay would not allow diabetes to slow him down. "I always knew that I wanted to be active. Sports was a priority in my life, even as a child." Jay stresses that parents should encourage their children to pursue any activity, regardless of a disability. The NFL lineman believes that parents can help by eliminating

continued on 57

ROLE MODELS

Getting "Pumped"

A new singing group called the Pump Girls is getting audiences "pumped" all over the country. The pop music group consists of four girls ages 12-15. The Pump Girls are Sarah Ann, 12 (their newest member not pictured), (counter clockwise) Brittany Rausch, 13, Colleen Cottrell, 14, and Sara Cronstedt, 15. These southern California girls sing about average teenage interests such as parents, boys, and dancing. But they also sing about some not-so-typical topics such as overcoming challenges and dealing with a life-altering condition. All of the girls in this group have Type 1 diabetes, and instead of taking insulin injections, they have been controlling their diabetes with an insulin pump, hence their name. (see box).

The group was started three years ago while the girls were on a family retreat, sponsored by PADRE (Pediatric Adolescent Diabetes Research and Education Foundation), which provides a wide range of services for children with diabetes including support groups and education. Brittany's mother, Corrie, was in charge of activities for the young girls. Corrie recalls, "Brittany and I thought it would be fun to do a skit and she had just gotten her pump. So we came up with the Pump Girls. We wrote the music and did it as a skit. It turned out that the company that makes the pump loved the idea and wanted to hear the song." This girl group that was put together by chance went on to produce an entire CD. The girls now spend one day a week rehearsing and keep themselves busy performing almost every other weekend.

The girls credit their insulin pumps with giving them more control over their disease and allowing them to become more active. According to Sara, "I feel better. A lot of time when you have high blood sugar you don't feel too good. You go from the highs and the lows and the peaks and the valleys, and you don't feel like yourself. I know that when I got my pump, I really started to have good control. I started to have more energy. It was an overall improvement in lifestyle."

In addition to singing and dancing with The Pump Girls, these young ladies lead very active lives. Colleen reports that she is constantly singing both in the group and in choir. Brittany is involved in soccer and Sara tutors elementary school children once a week.

Colleen advises other children and adolescents with disabilities to "keep a positive attitude and keep reminding yourself if you are willing to work at it you can control your disease and it doesn't have to control you. That's the kind of message we like to send out, that there's hope out there, that you can take control." Sara adds that one of the goals of the group is "to let as many people as possible know who we are and what we are about. We have such an important message. So many people deal with diabetes and if they don't deal with it personally, they know someone who does. So many people are affected by diabetes and a lot of people don't know that much about it. So basically our goal is to get our message out in a fun way. Although we deal with something that is out of the ordinary, we can still live life and live it to the fullest."

When helping children to be responsible for their healthcare, Brittany's mother, Corrie states that education is the most important thing. "The attitude the parent has makes all the difference in their child's. If they hate diabetes then their child is going to hate diabetes. If they are positive about it then their kids will be positive about it." She recalls when Brittany was 2 years old and had to take the usual diabetic blood test to check her blood sugar level. "We called it finger time and we made it a game and she looked forward to it." Corrie emphasizes the need for children to learn to control the disease themselves. "Parents walk a fine line between letting their children learn the importance of good control and all the while being in the background to help."

For now these girls show no signs of slowing down. They plan on continuing with their touring, making stops at children's hospitals, diabetes care centers, and schools where they can sing and get their message of hope out there.

For more information about The Pump Girls, visit their Web site at http://www.pumpgirls.com. For more information about the PADRE Foundation, call (714) 532-8330, or go to their Web site at http://www.padrefoundation.com.

The insulin pump, manufactured by MiniMed®, is a small programmable device, also known as a Continuous Subcutaneous Insulin Infusion or CSII, holds a supply of insulin and can be programmed by the user. As big as a pager, the pump is battery operated to send insulin into the body through a thin plastic tube called an infusion set. The infusion set contains a small flexible tube, called a canula that is inserted under the skin, and can be left in place for up to three days. The pump is worn outside the body, usually in a pouch or on a belt.

THE PUMP DELIVERS INSULIN IN TWO DIFFERENT WAYS:

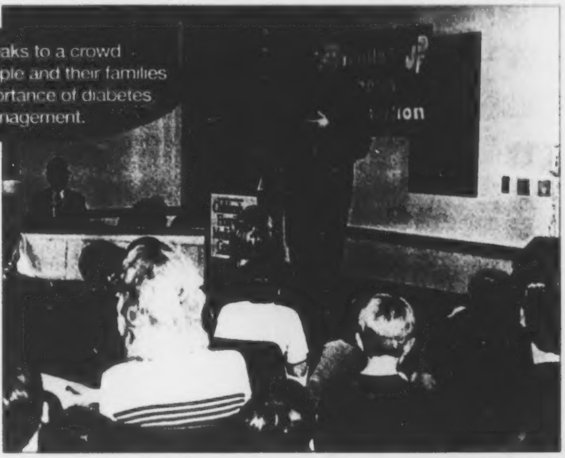
- **Basal Rate: A small amount of insulin, delivered continuously throughout the day.**
- **Bolus: a larger amount of insulin delivered over a short period of time.**

For more information on the insulin pump contact MiniMed at (800) 933-3322 or visit their Web site at http://www.minimed.com.

continued from page 55

any fear of the unknown on the part of others. "The key to a successful experience, whether it be in sports or in the marching band, is education. Educate the coach or leader on the signs of the illness and then explain how it is treated. This avoids any fear of the unknown." Jay and his parents took this up-front approach and explained his illness to his coaches and teammates from the beginning. Even now, in the NFL, he is always willing to answer questions concerning diabetes.

After coming to terms with diabetes and understanding its treatment, Jay played football in high school, where he was a starting member of the football team. His football career continued at the University of Colorado, where he was selected as one of only four athletes in the university's athletic history to be nominated as a unanimous All American. Jay started his NFL career first with the Chicago Bears, followed by the Indianapolis Colts, and he is now with the Cincinnati Bengals.



Jay speaks to a crowd of young people and their families on the importance of diabetes management.

Jay is actively involved in the Juvenile Diabetes Foundation. He spends much of his free time speaking to children about the importance of taking care of oneself when you have this disease. Jay advises that children should not feel limited because of their disease, and parents should not fear letting their children try new things. Jays feels that "any individual who has diabetes can do whatever the or she wants, but they have to take some important steps. It's different for every individual with diabetes, but there are some universals like checking your sugars, being on a diet, getting exercise, and taking your insulin."

continued from page 57

Jay is able to maintain a physically rigorous schedule by constantly monitoring his blood sugar. Using his blood glucose monitor, he checks his sugar eight to ten times a day on a non-game day and even more frequently on a game day. This allows Jay to have tighter control over his disease by adjusting his insulin according to his blood sugar for that day. He also suggests that individuals develop a system tailored to their needs by talking to their doctor or diabetes educator.

One of the reasons that Jay Leeuwenburg has dedicated himself to being a role model for children is because he did not know of any people who had diabetes that he could look up to when he was a child. He hopes that children will see the example that he sets and realize that people with diabetes can do anything they set their minds to. Jay cannot stress enough how important it is to take insulin shots. "The way I think of it now is that insulin is just life support until they find a cure."

Jay has hope that someday in the near future there will be a cure for this disease. With his work with the Juvenile Diabetes Foundation he hopes to raise awareness and educate young people on maintaining their health. Jay advises that people stay informed about the latest advances in diabetes research. "I like to stick with what works, but I found out there are better ways that I can be monitoring and living my life with diabetes. There's new technology, new insulins, and meters."

Jay has no plans of slowing down. Right now he is busy balancing the demands of family life, being an NFL player, and his obligations as a spokesperson for the Juvenile Diabetes Foundation. Jay wants parents and children alike to understand that diabetes does not have to limit you. Parents need to educate themselves to better understand the disease. Children need to know that with proper healthcare, they can lead active, healthy lives. As Jay would say "You need to control your diabetes, not let your diabetes control you." This sound, offensive strategy will control any defense, and any disability. **EP**

Beyond Access:
UNIVERSAL DESIGN FOR LEARNING™

by Anne Meyer, EdD, and Lucinda M. O'Neill

The ultimate goal of any student is to learn. However, having access to information is not the only essential ingredient in achieving that goal.

Education requires challenge and resistance. A balance must be found that allows maximum access (which requires reducing or eliminating resistance) and maximum learning (which requires meeting or overcoming resistance). Universal Design for Learning™ (UDL) is the paradigm developed by the Center for Applied Special Technology (CAST) for teaching, learning, and the development, selection and use of curriculum materials. Universal Design provides the challenge and resistance—requiring careful attention to the goals of any given learning experience when selecting curriculum materials and deciding what modifications are appropriate.

Universal Design in practice

If the goal of a teacher is to teach word decoding to a student with a learning disability, for example, having the computer read all of the words aloud could undermine learning. On the other hand, if the goal is to convey science concepts, having the computer read the text aloud could enhance the learning opportunity for the same student.

Each student, with or without a disability, is unique. Categorical approaches that label students, such as "disabled," "average," or "gifted," make broad assumptions about the similarities of students within categories while missing the differences. They also make assumptions about the differences among students across categories while missing the similarities.

Youngsters gathered around a computer at the CAST Center in Peabody, MA. CAST has put into practice their concept of learning through full access balanced with challenge.

Universal Design for Learning, as conceptualized by CAST, shifts old assumptions in key ways. First, students with disabilities fall along a continuum of differences as learners rather than constituting a separate category. Second, adjustments for differences in learning occur for all students, not just those with disabilities. Third, universally designed curriculum

continued on page 60

continued from page [illegible]

materials are varied and diverse, including digital and online resources, rather than centered on single textbooks. Ultimately, instead of "fixing" students so that they can manage a set curriculum, UDL "fixes" the curriculum by making it adjustable.

The concept of UDL evolved from the simultaneous emergence of new knowledge about the brain and new technologies for learning and communication. Neuro-imaging techniques have enabled researchers to better understand the neurological basis for differences in learning. At the same time, networked multimedia tools and content are now supporting the creation of flexible curricula in ways that were never before possible.

The "universal design" concept has its roots in architecture and product design, where physical access is the goal. Architects practicing universal design create structures that are dedicated to accommodating the widest spectrum of users, including those with disabilities. In universally designed environments, adaptability is subtle and integrated into the design. A distinct benefit of universal design is that designing for the divergent needs of "special" populations increases usability for everyone. The classic example is the curb cut. Originally designed so that people in wheelchairs could negotiate curbs, curb cuts also ease travel for people pushing carriages or riding skateboards, pedestrians with canes, and the average walker. Similarly, the widespread use of captioning on television has been a boon to exercisers, customers in noisy bars, individuals working on their language skills, and roommates who go to sleep at different times.

A DISTINCT BENEFIT OF UNIVERSAL DESIGN IS THAT DESIGNING FOR THE DIVERGENT NEEDS OF "SPECIAL" POPULATIONS INCREASES USABILITY FOR EVERYONE.

Flexibility allows access

Universal Design for Learning extends the concept of universal design in two ways: 1) it applies the idea of built-in flexibility to curricular materials, and 2) it requires that teachers use these flexible materials to provide more than "access" to help students learn.

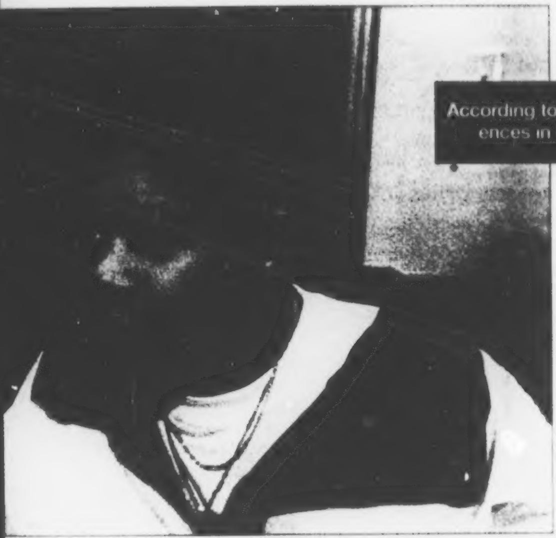
Because the key to UDL is individualization, the key characteristic of UDL materials is flexibility. Although individualization is theoretically possible with traditional materials such as textbooks, UDL is predicated on the flexibility of digital media and tools, including digital content, adjustable technology tools for accessing and operating on that content, and networked resources such as the World Wide Web. Non-digital materials tend to be

individual, self-contained units ("a" book, "a" video tape) and are largely inflexible—what comes out of the box is what you get, with essentially no viable means of modifying it. Teachers wishing to practice UDL with these traditional materials would confront virtually insurmountable problems. They would need large, costly collections of physical materials so that choices would be available for different students.

Electronic ease

Digital media, on the other hand, can be designed to be highly flexible because of their capacity to be transformed. Unlike a printed book—which has fixed, unchangeable text and images, but no sound, animation, or video–the digital environment (e.g., computers) can carry any and all media simultaneously. Text-to-speech or speech-to-text via speech recognition software can be programmed into online tools and software so that the transformation from one medium to another can take place for users who need the alternative medium. For example, if a student with dyslexia needs a particular word read aloud, the computer will read it "on demand." Image and video descriptions in digital speech provide access to those who cannot see the images. Captioning of dialogue, music, or sound effects, accomplished with a combination of text and graphics on screen, provides access to those who cannot hear the sound.

Text-to-speech and captioning are access features that become "smart" when they are designed with the instructional purpose in mind. The next generation of CAST software tools will go further, offering built-in teaching supports that make these products truly universally designed for learning. The current version of the CAST eReader™ offers text-to-speech and highlighting supports that help students with disabilities access information on the World Wide Web; the next version will help students develop Web-searching strategies



According to CAST, access to curriculum benefits all students because differences in learning occur for all students, not just those with disabilities.

to maximize their use of the Web for learning. Another tool under development at CAST will work with digitized textbooks to help students with learning disabilities develop the organizational skills that are critical to their success in school.

Although technology is at the heart of both UDL and assistive technology, it is important to clarify the differences. Assistive technology is designed to help individual students access the mainstream curriculum. Under most circumstances, assistive technology is necessary because the mainstream curriculum is inflexible and inaccessible to those students without it. For example, a video enlarger can make a textbook more accessible to a student who has low vision. But the enlarger is not a part of the curriculum, it is a device used by an individual student to overcome a barrier inherent in the curriculum's original design.

Assistive technologies can allow the learner to adapt to the curriculum. This way, there is access and the challenge is one that stimulates learning rather than hindering it. Rather than requiring a video enlarger to make 12-point black-on-white text legible to a student with a visual impairment, a UDL curriculum would include a digital version of the text that could easily be enlarged to the necessary size and changed in color if necessary. Once digitized, that text could be converted to speech and "read aloud" for students with difficulty decoding words. It could then be copied and pasted into a "concept mapping" software program for students with organizational difficulties. It can also be saved into an on-screen "notepad" which manages text for a student preparing to write an essay. The built-in flexibility eliminates the need for the assistive tool, and simultaneously improves learning opportunities for all students.

A student learns to use one of the software tools developed by CAST which allows access to class work material.

The full implementation of UDL may reduce but not eliminate the need for assistive technologies. As Universal Design for Learning becomes viable and pervasive, the power of assistive technology can be devoted to providing more efficient interaction with a curriculum that is already access-aware. For the students who need it, assistive technology will no longer be required to overcome barriers in a poorly designed curriculum, but it will enhance active interaction with a curriculum that has been designed at the outset to be accessible to all. **EP**

Since 1989, CAST has been engaged in the research and development of software products, Internet tools, and model educational programs that go beyond access to support learning. Universal Design for Learning™: Mind, Media and Instructional Design, a forthcoming book by Co-Executive Directors Anne Meyer, EdD, David Rose, EdD, and staff members of CAST, will explore issues discussed in this article in depth.

Anne Meyer, EdD, is co-executive director of CAST, the not-for-profit Center for Applied Special Technology, in Peabody, Mass. Lucinda M. O'Neill is a staff writer at CAST.

THE BUILT-IN FLEXIBILITY ELIMINATES THE NEED FOR THE ASSISTIVE TOOL, AND SIMULTANEOUSLY IMPROVES LEARNING OPPORTUNITIES FOR ALL STUDENTS.

WHAT'S HAPPENING

Beginning this month, What's Happening will include a new consumer product recall section. Each month we will publish information on a product that has been recalled. This information is obtained from the U.S. Consumer Product Safety Commission. For more information on product recalls, call (800) 638-CPSC or visit their Web site: http://www.cpsc.gov.

U.S. Consumer Product Safety Commission product recall information

In cooperation with the U.S. Consumer Product Safety Commission (CPSC) and the National Highway Traffic Safety Administration (NHTSA), Kolcraft Enterprises of Chicago, IL is recalling about 754,000 infant car seat/carriers for repair. When used as an infant carrier, the handle can unexpectedly move. When this happens, the infant can fall to the ground. Kolcraft is offering a free repair kit to address this problem. The Kolcraft infant car seat/carriers models to be recalled are: Infant Rider, Secura, Travel-About, Plus 4, Kolcraft Infant Restraint, Kolcraft Infant Car Seat and Playskool Infant Car Seat, all manufactured between January 1, 1993, and June 30, 1999. The five-digit model/style number and manufacture date, written as month/day/year, and possibly the model name are written on a label on the side of the seat. Some car seat/carriers were also sold with strollers. If the first digits of the model/style numbers on your car seat/carrier match the numbers in the following list, then it is subject to this recall: 1212X, 1382X, 1383X, 1384X, 1385X, 369XX, 43XXX, and 7700X. There are a total of 50 model/style numbers affected by this recall. To receive a free repair kit, call Kolcraft at (877) 776-2609.

New catalog of brain injury prevention materials available

HDI Publishers, in conjunction with the Brain Injury Association (BIA) and the Violence and Brain Injury Institute (VBII), has created a comprehensive list of brain injury prevention resources for teachers, parents, rehabilitation professionals, nurses, and others who have an interest in brain injuries. *Prevention & Educational Tools for Brain Injury* contains over 30 materials designed to help people understand more about brain injury—how it occurs, what happens when brain injury strikes, and what can be done to prevent it. Also included in the catalog are posters, folders, pencils, and coloring books for school-age children, as well as implementation manuals, calendars, and public service announcements for people working with children. For information on how to receive a copy of this publication, please contact Chas Haynes at (800) 321-7037 or E-mail: chaynes@hdipub.com. Information on brain injury can also be obtained from the Brain Injury Association's Web site at http://www. biausa.org.

Autism awareness rally in Washington, D.C.

On April 8, 2000, the Autism Resource Konnection (ARK), Inc., will be hosting a National Autism Awareness Rally in Washington, D.C. There will be information booths, professional and parent speakers, and a continuous slide show of people who have autism. "Unlocking Autism" will display a pictorial tribute of children affected by autism. For more information on submitting a photo, please call (225) 769-1532, or visit their Web site at http://www.littleangels.org. The first

CALENDAR OF EVENTS

APRIL
5-7

Human Services Consultants Management, Inc.

WOODLANDS INN AND RESORT, WILKES-BARRE, PA

Topics will include legal issues, applied behavioral analysis, and language development. For more information call (888) 879-8858; Web site: http://www.hscm.com.

APRIL
6-8

Building on Family Strengths: a national conference on research and services in support of children and their families.

HILTON PORTLAND, PORTLAND, OR

There will be paper and panel presentations related to improving services for families whose children and adolescents have emotional, behavioral, and mental disorders. For more information call (503) 725-8118; fax: (503) 725-4180; E-mail: elizabr@rri.pdx.edu.

APRIL
14-16

Abilities Expo New Jersey Convention Center.

NEW JERSEY CONVENTION CENTER, EDISON, NJ

Attendees will learn about the latest in assistive living products and services, as well as answers to important questions concerning insurance coverage, government regulations, and available services. For information call (800) 382-3085, Web site: http://www.abilitiesexpo.com.

APRIL
15-17

Developmental Disabilities Nurses Association Eighth Annual Education Conference

SHERATON HOTEL AND CONFERENCE CENTER, BURLINGTON, VT

This conference is for any professional interested or involved in the care of people who have developmental disabilities. Topics will include epilepsy, dental care of people with developmental disabilities, social skills, and basic genetics of people with developmental disabilities. For more information call (800) 888-6733; fax: (541) 485-7372.

APRIL
16-19

NISH 2000 National Training Conference

THE CRYSTAL GATEWAY MARRIOTT, WASHINGTON, D.C.

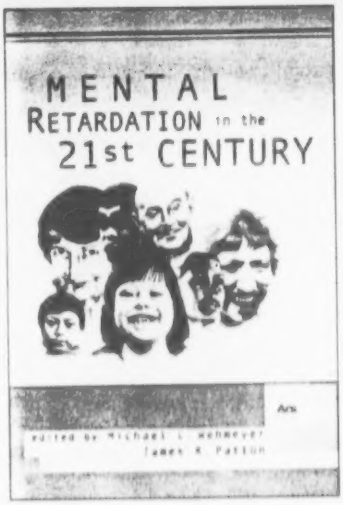
For more information call Lisa Ward, Director of Corporate Communications, at (703) 641-2757; 2235 Cedar Lane, Vienna, VA 22182. NISH is a nonprofit organization mandated by Congress to assist Community Rehabilitation Programs employing people with severe disabilities to obtain federal contracts under the Javits-Wagner-O'Day (JWOD) Act.

BOOK NOTES

Mental Retardation in the 21st Century

EDITED BY MICHAEL L. WEHMEYER AND JAMES R. PATTON

Published: 2000 PRO-ED, Inc. 457 pages
Available through the EP Library: (800) 535-1910: code PE181MR
Cost: $42.00 plus shipping and handling
Royalties from this book go to the Arc.



Mental Retardation in the 21st Century deals extensively with self-determination and self-advocacy for people with mental retardation, and examines the ways in which the concept of quality of life has evolved over the past two decades, and the direction it is taking for the future. Divided into seven sections, the book takes a look at all areas of life, from early childhood through adulthood, beginning with Family, and moving on to Education, Employment and Residential Issues, Psychology, Medicine and Health, Life-Span, and Policy.

Each section contains chapters written by various authors, including parents, advocates, and educators. The book contains both an author and subject index, and references at the end of each chapter. Chapters deal extensively with self-determination and self-advocacy, and examine the ways in which the concept of quality of life has evolved over the past two decades, and the direction it is taking for the future. The last section deals with policy issues, including service delivery systems and the social constructions of mental retardation during the last century. Social constructions are the ways in which the meaning of mental retardation has been shaped and changed, and the fact that these meanings have usually been the result of a search for social control rather than concern for the individual. It mentions various attitudes that were accepted in the past and suggests the need for a new definition, or even a new term for mental retardation, and the impact these changes could have on society.

In Chapter 16, "Toward a Brighter Future for Persons with Down Syndrome," the author, Siegfried M. Pueschel, MD, PhD, JD, MPH, of the Child Development Center at Rhode Island Hospital, writes first of the historical perspective in which Down syndrome has been considered. Immediately following this is a section titled "Accomplishments during the past decade." This passage highlights medical research in the field which may lead to improvements in care, including counseling of parents, addressing gastrointestinal anomalies, heart disease, cataracts, nutrition, early intervention, dental care, and many other concerns for children with Down syndrome. Pueschel then moves on to discuss education, of which he says, "When children with Down syndrome enter school, we often wonder what they will get out of their educational experience. We hope that school will provide the kind of stimulating and enriching experiences that make the world appear to be an interesting place to explore. Learning situations should provide children with Down syndrome a feeling of personal identity, self-respect, and enjoyment." He continues, "Through effective planning, development of appropriate support, and a shared commitment, post secondary educational programs can provide people with Down syndrome opportunities to pursue their dreams and goals." The chapter addresses meaningful employment, living options, and relationships. In his conclusion Pueschel writes, "Beyond the myriad of future research possibilities…many more investigations need to be carried out to increase the knowledge in this field which, in turn, will improve the quality of life for persons with Down syndrome."

Chapter 18, "Riding the Third Wave: Self-Determination and Self-Advocacy in the 21st Century," by Michael L. Wehmeyer, PhD, Hank Bersani, Jr., PhD, and Raymond Gagne, deals with the self-advocacy movement, and the course it is taking. The first section of the chapter is entitled "Powerless Lives," and details the stereotyping that accompanied mental retardation throughout the 20th century. Included is the story of Raymond Gagne, who is now a leader in self advocacy and self-determination. He was born in 1945 with cerebral palsy. He writes of his childhood in an institution, where he was treated with inhuman cruelty. When he reached adulthood, he left the institution, became involved in self-advocacy and now leads a fulfilling, independent life.

The authors write that, "Many self-advocates actively campaign against congregate settings, such as nursing homes and advocate for social justice…In addition, self-advocacy groups have become a training ground for leaders, enabling people with mental retardation to assume leadership positions. Self-advocates now sit on visible boards and committees, including the board of directors for organizations like the Arc, the American Association on Mental Retardation, and TASH as well as serving on the President's Council on Mental Retardation and the President's Committee on the Employment of Persons with Disabilities."

Gunnar Dybwad, PhD, concludes the book with his "Epilogue," paying tribute to the energy of the parent movement: "It is indeed regrettable that the far-reaching effectiveness of the parent movement, just now celebrating 50 years of successful advocacy, has not been given the attention it deserves in much of the professional literature. As professionals, and friends of people who experience intellectual disabilities, we must never overlook the far-reaching effectiveness of the parent movement…Today, advocacy organizations across the globe advocate for and with people with intellectual impairments in uniform agreement of the importance of community inclusion for all." Dr. Dybwad writes about how past atrocities against people with mental retardation in institutions must not be forgotten, and calls on professionals to acknowledge their role in the situation.

Discover New England Village

Where adults with mental retardation lead fulfilling, enriched lives.

When our parent founders established New England village as a private nonprofit corporation in 1966, they had a vision of something better for their children... a warm, caring stable and secure environment where young adults with mental retardation can lead a high quality lifestyle with opportunities for growth and friendship.

Discover the quality of life enjoyed by New England Village residents. Our campus, set on 80 beautifully wooded acres just 25 miles south of Boston, offers attractive contemporary style homes and townhouse apartments. Learn about our full range of residential options, extensive vocational and education programs, and wide spectrum of recreation and social opportunities. We invite you to meet our dedicated and caring staff and speak to other families about our village.

Call (781) 293-5461, or write Judy Andracchio, Admissions Coordinator, to arrange your personal visit or request our brochure and video presentation. We invite private and state-sponsored referrals.

PERINATAL

MEET THE PERINATOLOGIST:

An Introduction to This Specialist's Role in Caring for Your Child

by John Joseph Botti, MD

An obstetrician, primary care physician, or midwife can handle most routine pregnancies. When complications are anticipated because of the mother's medical history, or if they crop up during the pregnancy and threaten to affect the health of the fetus or mother, a specialist may be required. The perinatologist, a specialist in maternal-fetal health, is the person who often receives these referrals. The referrals are frequently made when the mother's health provider wants her to receive care where there is a neonatal program.

In addition to basic obstetrics and gynecology training, the perinatologist has completed a two-year or three-year clinical and research fellowship. During this fellowship, he or she receives advanced training in comprehensive diagnostic ultrasound imaging of the fetus. These studies look for abnormalities in the head and neck anatomy, spine, heart, chest and diaphragm, stomach, kidneys and bladder, abdominal wall and umbilical cord, upper and lower extremities, the placenta, and the volume of amniotic fluid. These targeted ultrasounds are usually performed at about 18 to 20 weeks. Further studies may be recommended later in the pregnancy if there are problems that could affect the growth and development of the fetus, such as problems with the volume of amniotic fluid—or the function of the umbilical cord—that could affect blood flow.

Many perinatologists also develop diagnostic skills and can perform complicated procedures when serious fetal disorders are suspected. This may include sampling of the fluid surrounding the fetus (amniocentesis), obtaining blood samples from the umbilical cord, or placing catheters into the fetus.

The knowledge gained from these diagnostic procedures may contribute to therapeutic management and buy valuable time for the fetus until neonatologists (specialists in medicine of the newborn) can take over after delivery. Management of fetal health may also include administering medications across the placenta or amniotic fluid to correct a problem before birth.

In some cases, the perinatologist may be the best person to perform the delivery of a high-risk pregnancy, such as a multiple birth (twins, triplets, etc.). Perinatologists may plan and coordinate the delivery of mothers with medical problems, such as diabetes. They will also work with the neonatal care team to develop a plan for specialized care immediately after birth for babies who will need special management. The perinatologist may also consult with a genetic counselor if the need arises. For example, if the family has a history of diseases with a genetic basis, or the laboratory tests indicate a child is likely to be born with a genetic disease. The counselor can help them understand the actual meaning of the clinical diagnosis and its implications for the child's growth and development.

Perhaps the most significant contribution of the perinatologist is as a communicator. When given unsettling news about their baby, parents need information from a knowledgeable and caring doctor who can provide reassurance. The perinatologist can act as a sounding board for parental concerns, provide options for care, and act as a liaison between the referring doctor and the other members of the healthcare team who become involved after birth. Careful collaboration among perinatologists, neonatologists, and pediatric surgeons, or pediatric cardiologists, improves the prospects of a healthy outcome for an infant with special healthcare needs.

As advocates for both baby and mother, perinatologists are in a unique position to maximize perinatal health outcomes.

This series will continue with a description of the various specialists the parents and child will encounter in their efforts to promote the growth and development of the child. **EP**

John Joseph Botti, MD, is Professor of Obstetrics and Gynecology and Radiology at the Pennsylvania State Geisinger Health System, Hersey Medical Center, PA. He has spent more than 20 years as a specialist in maternal-fetal medicine, caring for high-risk women and families.

FAMILIAR FACES

Ashley Azzardi (left), 5, and **Artie Conforti**, 1, enjoy playing together! Ashley has cerebral palsy and uses a powerchair. She started kindergarten last fall and loves it. Artie was born without his left hand. He uses a passive prosthesis and has adapted quite well. Artie receives occupational and physical therapy weekly. The two friends love Teletubbies and Rug Rats. Ice cream is also a favorite of both! Ashley lives in Uniontown, PA, with her mom, Kris, and dad, Anthony. Artie lives with his parents, Tina and Bill, in Greensburg, PA.

According to his "Grammy," Lena Lou Thomas, **Matthew Davis Gibson**, 6, brings joy to his whole family. Matthew suffered brain damage at birth and uses a wheelchair. He is nonverbal, but Lena says, "He is a bright child who likes letters, numbers, and music." His favorite activities are watching TV, being read to, and swimming. He enjoys attending Gateway Education Center in Greensboro, NC. Matthew lives in Jamestown, NC, with his parents, Jim and Jenny, and brother Sam, 4.

Allison Werne, 17, has cerebral palsy and uses a wheelchair. Her favorite activity is mowing the lawn, something she can do now that her dad engineered a special adaptive device. Allison will graduate from high school next year and is writing a book about her life. She lives with her parents, Terry and Gail, and her sisters Korrine, 20, and Katelyn, 13, in Huntingburg, IN.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of *EXCEPTIONAL PARENT*? Send it to: Readers' Photos, *EXCEPTIONAL PARENT*, 555 Kinderkamack Road, Oradell, NJ 07649-1517. (Please do not send originals or "one-of-a-kinds" as we regret that photos cannot be returned.)

Kristen Elizabeth McGuire, 3, poses for a portrait with her brother **Joel**, 6. Kristen has mitochondrial disease with multiple disabilities and central sleep apnea. She is nonverbal, nonambulatory, and has a feeding tube. Kristen attends a special preschool and enjoys it very much. She is fond of being rocked and talked to. She recently had water therapy for the first time--she loved it! Kristen and her brother live with their mom, Janelle, and dad, Mark, in Burlington, IA.

Chandler, 6 (left) and **Spencer Osborn**, 9, clown around! Both boys have lissencephaly (smooth brain), microcephaly (small head), profound mental retardation, seizure disorder, spasticity, and cortical blindness. They receive home-based occupational therapy twice a week and are cared for at home by a private nurse. Both boys love to snuggle and be held. They live in Boise, ID, with their parents, Doug and Shirley.

Big sister, **Laura Grassi**, 10, and **Carolyn**, 6, take time out for a picture. Laura has cerebral palsy and uses a walker. The fifth grader enjoys horseback riding, computers, drawing, and watching hockey on TV. The sisters also have a brother, Stephen, who is 9. Laura and her siblings live with their parents, Elizabeth and Sebastian, in Troy, MI.

***Now on the Web!** We will now be including Familiar Faces and Children's Page on our Web site, www.eparent.com. Please send us your photographs with the understanding that doing so gives Exceptional Parent permission to put the photos on the Exceptional Parent Web site, exactly as they appear in the magazine and with the same text.*

On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

ASK THE THERAPIST: Hip Stability and Learning to Stand

by Ginny Paleg, MS, PT

Q *Samuel is four years old. At five weeks of age he was the victim of severe child abuse. He was diagnosed with "shaken baby syndrome." Samuel came into our lives at the age of two months. We left the hospital with a beautiful baby who wasn't expected to live, would be tube fed, blind, deaf, have cerebral palsy, seizures and with no chance at ever having any independence. Since then, Samuel has made great strides, and we celebrate each one. He is a very happy healthy 42-pound boy. He is not tube fed; he is blind, but his hearing is very sharp. He has been seizure free for three years. Samuel has low tone and loves being around children, music, and school. Samuel's smile and giggle brightens the room.*

We are very concerned about his hips and we feel there is more to his life than sitting in a chair or lying on the floor. My dream is that Samuel can stand for transfers and maybe even learn to walk. How can we help him?

—B. H., Vinton, Virginia

A You are wise to be concerned about Samuel's hips. Hip dislocations and bone deformities can be the result of lying or sitting in one position for extended periods of time. It is not surprising, then, that hip displacements often begin early in the life of a child with severe disabilities. In many children, hip dysplasia (abnormal development of the hip joint) is the result of one group of muscles contracting more strongly than the opposing group of muscles. Bones grow and are formed based on the way muscles pull on them, so low or high muscle tone has an impact on bones.

Hips are particularly vulnerable to deformity. In many joints, the structure of the joint itself is what keeps the bones aligned. In the hip, muscles must align the bones. A child with low tone has very little muscle strength to keep the top of the femur (thigh bone) in alignment with the acetabulum (cup-shaped socket in the pelvis). With normal muscle activity and weight bearing, the pull from the muscles actually shapes the angle and orientation of these two bones. Without this pull or weight bearing, the joint can fail to form properly.

There are two separate issues to consider. The first one concerns hip stability. When a person is properly aligned in a stander, the head of the femur can be pushed into the hip socket as a result of stacked body weight. This pressure can deepen the socket and make the hip more stable.

Children who are not yet walking can benefit from standing with support. There are two basic types of standers. One gives support from behind the child (supine) and the other gives support from the front (prone). The direction of support does not make as much difference as the degree of incline of the person's body. If Samuel is reclined on a supine stander (even slightly), he will not need to actively use his muscles. If he is upright or leaning slightly forward, he will need to work at controlling his head and upper trunk. When he picks up his head, he will have a tendency to use leg muscles as well. The prone stander combines passive stretching while strengthening the upper trunk and promoting head control.

Standing for 45 minutes a day can also help to maintain bone density and slow the rate of development of osteoporosis. The other benefits of standing include improving respiration, circulation, digestion, and excretion.

Active standing

Traditional stationary standers do not help children learn to stand any more than sitting in a parked car helps a person learn to drive. Active participation is required if its purpose is to be served, so the second issue is learning to stand. Learning to stand without support requires the child to coordinate opposing muscle groups to keep the body from collapsing. This requires self-initiated muscle activity. From my experience, the most effective way to teach children to stand is to

teach sit-to-stand transfers. Sometimes, holding children in a standing position and gently bouncing them on their feet helps to increase tone and activate muscles. Whenever possible, these skills should be incorporated into life activities rather than practiced in isolated sessions. Samuel's therapist can teach you ways to do this. For example, every time Samuel moves from one position to another, he should be encouraged to help push himself to standing and bear his weight for a few seconds. This assures that Samuel practices his skills in short sessions so he does not become fatigued, and the strain on you is reduced.

> Hip dislocations and bone deformities can be the result of lying or sitting for extended periods of time.

The newer standers are combined with large wheels that enable children to push themselves around their environment. The best ones allow variable hip extension as well as variable degrees of trunk support. As the child gets stronger, support can be decreased. When the child pushes the wheels, muscles throughout the body are activated. (See next month's issue of *Exceptional Parent* for a full report on self-propelled walkers.)

Another alternative is a gait trainer. These devices are similar to walkers but offer more support for the trunk, hips and arms. If used properly, gait trainers can help a person learn to stand and take steps. Many gait trainers can be adjusted to give maximal trunk support so that active weight bearing can be taught without another person having to support the weight of the child. Children can practice skills and strengthen muscles without requiring a burdensome amount of assistance from the adult.

Expectations

Doctors and therapists often tell families that their children will never walk. This is based on research conducted mostly in the 1970s. Today we know more about the brain and how it develops. Normally-developing children do not fully integrate and use the cerebellum (the part of the brain used for balance and coordination of muscles) until they reach 4 to 6 years of age. The frontal lobe (the part of the brain responsible for logic and reasoning) is not fully functional until puberty. I do not think we can really predict Samuel's potential.

No matter what the future holds, in order for Samuel to be as functional as possible and to make it easier for you to care for him as he grows, he should begin to learn to sit, stand, and walk now. Here are some suggestions for working toward your goals:

- At home and at school, he should sit upright in a correctly sized chair for short periods of time. If possible, he should be seated at the same height as his peers and in the same environment. He should have enough support to keep him safe, but he should be encouraged to move out of balance and then back into balance while sitting. This should be done during a classroom or home activity. An example of this activity is leaning and reaching to one side to get a toy.
- He should stand a minimum of 45 minutes a day. This can be accomplished in several sessions if he gets bored or seems uncomfortable.
- He should help assist in a pivot transfer each time he is moved. He should also be expected to help raise himself from a sitting to standing position.
- If possible, he should be encouraged to extend his own hips and knees to maintain his body weight for increasing periods of time as he grows stronger. Diaper changes can be done in this supported standing position.
- If a gait trainer is an option, he should be encouraged to stand and use his legs to move himself around.

Samuel is fortunate to have loving parents who are looking to his future. He needs the opportunity to learn, to practice these skills, and to understand the reasons for doing these things. Rather than setting up an "exercise program," he needs to use his skills within the flow of his real life. As he grows larger, he will be increasingly difficult to lift and move. He needs the dignity of bearing his own weight. He is far more like the rest of us than he is different. Good luck and keep up the good work. **EP**

In this column, Ginny Paleg, a pediatric physical therapist, answers questions from readers. Ginny works at The Hospital for Sick Children, in Washington, D.C. She specializes in treating children with developmental disabilities and neurological dysfunction.

Since Ginny has not assessed the child in question, parents need to review her suggestions with appropriate professionals. Mention of specific products, medications or treatment techniques illustrates suggestions; she is not endorsing any specific products.

Sites from the Heart

Special Needs Advocates Share Their Caring Online

by Vanessa B. Ira

It happens often enough. When the parent or caregiver of a child with a disability realizes that the work they give to one child is so important, they feel compelled to do even more. Serving the children they love is such a powerful elixir that many of these caregivers still try to find ways of reaching out to others who may be going through their ordeal for the first time.

The Internet has made it easy for parents and caregivers to share such knowledge and experience. Following are some sites that were created by those individuals. There are many more out there which EXCEPTIONAL PARENT will cover in the future.

- IRSC.ORG (http://www.irsc.org)—The Information Resources for Special Children (IRSC) Web site was created by a parent of a child with multiple disabilities, born in 1983, who felt the need to share all the valuable information he has so far gathered. The heart of the site is a long list of links to disability sites which are marked by the date they were added to clearly show which ones are current. Archived links go back to 1997.
- NJTRUSTEKIDS.ORG (http://www.njtrustekids.org)—The Children's Emergency Medical Fund of New Jersey has set up this child-friendly site containing links to Web sites with resources to brighten up the days of homebound kids with disabilities: wholesome children's games, Great Books, electronic greeting cards and more. The idea behind providing those interactive tools is an extension of the Fund's overall mission to enhance the quality of the "Truste Kids" lives. It keeps the children's lines open to the world of caregivers, doctors and other children, 24 hours a day. The site also provides useful resources for the caregivers, such as links to sites about foundations and grants; medical resources; and "sites for mom."
- PACER CENTER (http://www.pacer.org) —The Parent Advocacy Coalition for Educational Rights (PACER) Center's Web Site offers a motherlode of disability resources including: Legislative Information; Employment Strategies for Youth and Adults with Disabilities; information on IDEA; and a section on Emotional Behavioral Disorders. A newly added resource called "TA Alliance" links to information on the Technical Assistance Alliance for Parent Centers, funded by the U.S. Department of Education, Office of Special Education Programs. The Alliance offers resources to assist the Parent Centers in strengthening their ability to serve the families with children who have disabilities. **EP**

Annandale Village: *Their Community... With Our Help!*

Our Mission:

...to perpetuate a private, nonprofit Village community offering adults with developmental disabilities an improved quality of life. The Village provides professionally managed and cost effective lifestyle alternatives through specialized programs and services flexible enough to meet individual needs. These programs are a significant part of our original goal of offering a balance of freedom, encouragement and instruction that help each Villager achieve his or her own level of independence and fulfillment.

Our Programs:

- Paid Vocational Training and Job Placement
- Creative and Performing Arts
- Recreational and Leisure Activities with Skills Training for Special Olympics
- Daily Living / Life Skills

PART 2

Strength in the Face of Adversity

Last month, we introduced our readers to the Crowley family from Pennington, New Jersey, our newest inductees into the "EP Hall of Fame." Parents John and Aileen spoke to us about caring for their three children, John Jr., 5, Megan, 3, and Patrick, 18 months. Megan and Patrick both have Pompe's disease, a rare muscular disorder.

Pompe's disease is caused by a genetic defect that prevents the body from producing a crucial enzyme called acid maltase. In healthy individuals, acid maltase breaks down sugars that are stored in the body's muscle cells. In Pompe's disease, the absence or insufficiency of acid maltase forces the body to continually store sugar in the muscle cells in the form of glycogen. Glycogen storage rapidly causes the muscle cells to deteriorate. This results in progressive weakening and deterioration of the muscles. Glycogen also accumulates in the liver, muscles, nerves, and heart, preventing them from functioning properly.

The demands of the disorder have invaded every aspect of the family's life and prompted their efforts to raise funds for research into the disease. It has forced them to be their own advocates when dealing with their insurance carrier. This is the second part of our interview with the Crowley family, as they relate their experience in their own words.

MEDICAL EXPENSES

The level of care that Megan and Patrick need every day, around the clock is extremely costly. John and Aileen have managed to convert the insurance companies from adversaries into partners, by making them see the human side of Megan and Patrick's illness.

JOHN CROWLEY: The care for Megan and Patrick at home and the 24-hour nursing care alone is a quarter of a million dollars a year. Beyond that are the equipment, visits to the doctors, and hospital stays. Fortunately we have not had many of those this year. All together, Megan and Patrick's medical care runs close to $500,000 per year. We are very fortunate in working for Bristol Meyers Squibb. It is a company that is dedicated not only to its customers but also to its employees in its mission of extending and enhancing human life. They have helped tremendously with the financial burden of this.

The insurance company, United Healthcare, has been great, too. But this has required many discussions.

When we first took Megan and Patrick home, the insurance company told us we will get 24-hour nursing care for a couple of weeks, then 16 hours, then they said they believe that having a child on a ventilator is a home care skill they could teach us and then we won't have nursing care. I just said from day one that is absolutely not possible, not acceptable, and fought very hard. I think they realized the uniqueness of this situation and the unique needs, and since that time have been very supportive. For example, the nurses that United Healthcare originally provided through their agency were uniformly horrible. We fired about 22 of them for gross incompetence.

The Crowley family at home (l-r): Aileen, holding Patrick; John Jr.; and Megan, with John Sr.

How one family meets the challenge of debilitating illness

Megan Crowley gets star treatment at one of the fund raisers [illegible] The Children's Pompe Foundation.

After a couple of months I just said stop. We can find better nursing care with the money you are giving these agencies.

The insurance company was very flexible in working out an agreement with us to allow us to directly hire the nurses and to pay them directly.

AILEEN CROWLEY: There is no middleman getting a cut and therefore we have excellent nurses.

JOHN: As a result, we interview and choose our own nurses ourselves.

John and Aileen have been their own advocates with their insurance carrier.

JOHN: When they (the insurance carrier) wouldn't listen, I went to our HR (human resources) people and our benefits people and told them the story. You have to put a very human side to it and try to explain to them in very layman's terms what it's like living in the house without nursing care, and it's impossible. The alternative is to institutionalize the child, and that's something that is completely, as a lifestyle, completely unacceptable to us.

It also did not make economic sense for them. So you have to make arguments on a number of different grounds and realize that at the end of the day, these are people with kids, too.

AILEEN: They have their certain rules that are outrageous. When Patrick came home from the hospital, they said they would pay for two nurses in the home at a lesser price. I said I don't want two nurses at a cheap price. I want one nurse that we can pay good money to. They said we don't do that. That doesn't make any sense, they were going to pay double, pay for two nurses, when they could have paid for one nurse.

JOHN: Once it was explained to them, they understood and they became very flexible and very supportive. Without that support I don't know what we would be able to do. There are other programs, there are state programs, the state catastrophic medical insurance fund, Medicaid, but fortunately we have been able to navigate through the private insurance right now.

We probably have $30,000 a year unreimbursed, uncovered medical expenses.

THE NURSE AND THE AU PAIR

The Crowley household benefits from the services of two live-in caregivers, Sharon (a nurse) and Ann (an au pair), who live downstairs in the Crowley's house. They are always available to provide whatever help is needed.

AILEEN: Sharon is wonderful with the children. She also deals with the surgical supply company, and she is tough, she is on their case if they are not here.

She always has been a travelling nurse. She and Ann have become good friends. It's hard having strangers in your house all the time. It's so rare that John and I are ever alone. They give us our space and they get their own space downstairs.

It's hard to have non-family members living in your house, but they are very respectful as we are of their privacy, too. Downstairs is theirs pretty much, they have their own TV and couch and refrigerator and stuff. Sharon needs her time away, too; she puts in 12-14 hour days with kids every day that she is here. They have become part of the family. The kids are very excited about Ann's birthday.

We lucked out with Ann, so many people have stories with au pairs and how things just don't work out. She wanted to learn how to take care of Megan and would take shifts at the hospital. Megan was in the hospital for six weeks first, and she and Patrick were in the hospital last March for 3-4 weeks. We all took shifts. Ann took the night shift some nights. She did more than most family members.

ADVICE TO OTHER PARENTS

JOHN: People have different ways of coping, different ways of taking care of their children; different ways of dealing with it. There is no one right way of doing it.

We were determined to fight the disease and I guess my recommendation for parents in similar situations is to be as curious and as challenging as you can, always respectful, but curious and challenging.

The doctor in California, the pediatric neurologist who diagnosed Megan, told us that day he did not know of any research going on. It was an extremely rare disease and, according to a footnote in his medical textbook, Megan had about two months to live. I didn't know anything about rare genetic diseases. I knew there were hundreds of thousands of them. I didn't know how they got cured, how they got treated, who works on them.

Then we found out very quickly on the Internet, first of all, that there were doctors working on it. So my first advice is to find out who the top doctors are, who are writing the papers on these diseases, which have done PhD theses on them. Then contact the doctors, see where they are in their research, see where their funding levels are. I had always assumed that if the researcher thought he had the cure to it, or was close to a cure, that he would find research money—from industry, government, families, foundations, somewhere. I found three or four doctors working on Pompe's disease who had virtually no funding at all.

It was very frustrating. You are hopeful, knowing that there are doctors working on a cure for Pompe's disease. But because there wasn't enough funding, your child isn't going to have access to it, and it may never be developed, or not for a long time. That was something that we are determined to change. For parents in that situation, I would say never give up, keep driving, always challenge, and always learn. You will find that doctors and researchers will welcome your support, even just to tell you and teach you about their research.

THE CHILDREN'S POMPE FOUNDATION

JOHN: The past year, we started our fundraising in November of 1998. Altogether we have raised about a million and a half-dollars in a little over a year. It started with a letter-writing campaign to friends and family. When they know about it, they'll tell ten friends, and they will tell ten friends. The media exposure has been helpful, too.

AILEEN: We get lots of encouraging letters, too, which is nice.

JOHN: Some letters are from people who can sympathize or empathize, because they've had a child who died. We've gotten letters from people who've read the story in national magazines and they will tell us that they had a brother who died of Pompe's disease in 1960. Their dream is that this gets cured, and they send $50 in his memory. Or we hear from parents of children who have disabil-

At Devereux...
a helping hand is just a phone call away

1-800-345-1292

In a nationwide network, Devereux provides services to individuals of all ages who have a wide range of emotional disorders and/or developmental disabilities.

Devereux services include:

- residential treatment centers
- community-based group homes
- day treatment programs
- transitional living
- acute and partial hospitalization
- foster care homes
- family counseling and therapy
- in-home services
- aftercare programs

Devereux

continued from page 77

ities or disorders who can empathize with us. Then we will get letters from people who are thankful who say, they have beautiful, healthy grandchildren, and couldn't imagine what we are going through. I thank God that we are healthy and we are sorry your family isn't and here's what we can do to help.

AILEEN: It's amazing. One Sunday school Nursery School all wrote letters. It was nice.

JOHN: They had a bake sale, it was a preschool, and they raised about $90, in fact I have to tell you because after they raised $97.10. They each sent a letter; we had no idea that this was going on.

Megan relaxes at home with her au pair, Ann, who is part of the team that cares for the Crowley children.

One of the 5-year-olds wrote in the letter, Dear Mr. and Mrs. Crowley, I am sorry to hear about Megan and Patrick. I hope they get better soon. We tried to raise a lot of money for you, but we didn't do really good, we only got 97 bucks. She signed it, and the teacher made her put a line through the part that said we really didn't do really good, we only raised 97 bucks. From the mouths of babes. I've kept all those letters.

AILEEN: I want Patrick and Megan to read them.

JOHN: Megan and Patrick better be pretty good kids when they grow up. I'll say to them, "You want to stay out *how* late? Let me tell you about what I did for you when you were a kid..." **EP**

Part 2

PARENTS' PERSPECTIVES ON AAC:
Making sense of technology and making it work

by Peggi McNairn, PhD, CCC/SLP, ATP, and Cindy Shioleno, MEd

With the realization that their children will require technology to assist and support them in their lives, parents often enter a world alien to them. This is a world filled with "techno-jargon" and foreign gadgets. That was the case for Ed and Brenda Klauditz family of Toms River, New Jersey. "When Daniel was born seventeen years ago, we really did not realize the extent that he would be disabled. As it turned out, Daniel has cerebral palsy and is very involved," reflects Brenda. "By the time Daniel was 2 years old, I was on a mission to find a way that he could communicate," she recalls. "He was very frustrated. Even though I am a master of guessing and my son the master of cluing, the better I got, the more complicated the things he wanted to say became. So we were both in need of something better."

The Urschel family: Christi, Dr. Hal, and their 4-year-old son Chance.

AUGMENTATIVE AND ALTERNATIVE COMMUNICATION

According to the American Speech-Language-Hearing Association (ASHA), augmentative and alternative communication systems, or AAC, "refer to all communication that supplements or augments speech." AAC covers a broad range of techniques, strategies, and devices, from simple picture boards to sophisticated, computer-based communication devices with synthetic voices. Other examples of augmentative and alternative communication may include facial expressions, gestures, body postures, sign language, drawing, and writing.

LIGHT TECH AAC DEVICES

Simple augmentative communication devices that do not use electronic or computer parts, such as the use of pictures attached to a board or inexpensive devices that can record a voice, are often referred to as "light-" or "low-" tech devices. For young children, light-tech options may be the first type of AAC that is introduced. These simple devices are typically used to facilitate the development of emerging language and communication skills. Light-tech devices should be introduced early because they use skills that children may have mastered, such as pointing with their hands or even their eyes.

However, even light-tech AAC options can prove overwhelming, time-consuming, and cumbersome. For Dr. Hal and Christi Urschel of Dallas, Texas, the introduction of a light-tech system to their 4-year-old son, Chance, was particularly challenging. One of the light-tech AAC devices that Chance uses has pictures attached to a clear, plastic square panel. Beginning with only four pictures, Chance quickly moved to twelve pictures that he selected by pointing with his eyes. The Urschels make sure that someone works with Chance and his AAC device every day. "Being able to implement even simple technology in only a few of his daily activities, such as eating, bathing, and playtime, requires a significant amount of consistency and continued enhancement of his system."

HIGH TECH AAC DEVICES

Often, because light-tech systems are simple, they may also prove to be very limiting. When this occurs, high-tech AAC systems should be introduced.

[illegible] communicating with his technology.

Parents of children who use augmentative and alternative communication (AAC) devices share helpful information, stories, and insights about their experiences with the process of selecting and using communication systems.

Today there are many high-tech communication devices on the market. Some devices are manufactured specifically for communication. These are referred to as "dedicated" communication devices. Although these devices may perform many functions similar to those of a computer, they do not often resemble one.

Laura Warburg of Louisville, Kentucky, the mother of 8-year-old Candice, says the use of a dedicated AAC device strengthens her daughter's ability to communicate verbally. Born with cerebral palsy, Candice did not have a way to communicate when she began kindergarten. However, her mother reports that, "Today, she has a DynaVox mounted to her wheelchair. She studies for spelling tests and tells jokes with it." Brenda Klauditz believes that "without the technology, Daniel would not have a chance at this life of his because he is so physically involved. He enjoys his technology."

A second type of high-tech communication device is called "integrated." Using the computer as a base, special software is added to enhance the computer's ability to function as a communication device. According to Dr. Urschel, "Once we decided to choose a standard laptop computer, we realized that, in addition to the many benefits it has for Chance, it is also familiar to other people and consequently, it is less threatening for them to interact with him."

Most dedicated and integrated AAC devices offer some form of voice output. The voices in these devices are referred to as either "synthesized" or "digitized." Synthesized speech is produced artificially by a computer program. Digitized speech refers to sounds and speech that are recorded and stored in the device. Some devices now offer both synthesized and digitized voice options.

LIGHT TECH VS. HIGH TECH

The use of light-tech devices does not exclude the additional use of high-tech AAC devices. In fact, AAC is most effective when thought of as a "system" rather than a specific device or piece of equipment. The greater the variety of communication options that a child has to choose from, the better opportunity he or she will have in communicating his or her thoughts in every situation. Using this systems approach avoids the many pitfalls of relying on only one device or technique. If a high-tech system breaks down and needs repair, light-tech systems can serve in the interim. Also, some situations, such as bath time, may not lend themselves to the use of a high-tech system. "I believe that we need to use both high- and light-tech devices," says Mrs. Klauditz. "There is a place for both. When making choices on which device to use, the user's needs should be the priority."

MATCHING NEEDS

Before any system can be successful, the needs of the child and family must be the first consideration of the AAC assessment team. There are many factors that will influence the successful implementation of any AAC device. These factors include: vocabulary and icon selection; weight; appearance; and portability of the device; ease of programming the device; access and positioning; and funding options.

These systems must also be capable of growing and expanding with the child's changing needs. "We needed a system that helped us prove what Candice was learning at school and one that enhanced her early reading and language development," recalls Laura Warburg. "Because of our late entry into the high-tech AAC game, we also needed a device that would help Candice express herself in the social situations she was starting to crave."

VOCABULARY AND ICON SELECTION

Choosing the best way to represent language in a picture or word format is one of the most difficult tasks for an assessment team. Decisions must be made as to the use of pictures or words to represent what the child wants to say to others. Within this vocabulary selection format, there is a range of options to consider. Vocabulary may be programmed to relate to a specific activity that occurs during the child's day—a core vocabulary of general, frequently used words or a combination of both approaches. It is important that the team stay focused and committed to the common goal of assisting the child to become a successful communicator.

Weight, appearance, and portability will affect the every day use of the device. A heavy device may be an important issue for a small child who may have difficulty carrying it.

Ease of programming and use are also important factors to be considered in the

continued on page 82

continued from page 81

assessment process. Devices that are difficult or confusing to program will often intimidate people who are unfamiliar with or new to technology. Training and technical support from device manufacturers, either on site or over the telephone, is critical for successful implementation to take place.

How the child will physically control the device will often determine which products are appropriate. Not all children with physical challenges may be able to use their hands and fingers to touch the keys on a computer or communication device. Many children will need an alternate way to access their devices. Enlarged keyboards and screens, special keyguards, and wireless infrared remote controls are only a few options available for high-tech access. This was one of the first challenges that faced the Urschel family.

"In our son's particular case," observes Dr. Urschel, "because of significant motor impairments, we needed to remove the motor component from his communication as much as we could to allow him to communicate at a normal speed." Today, Chance is learning to communicate and read using a special, hands-free infrared mouse attached to his laptop computer.

Finding the appropriate funding source for technology is also important during the assessment process. Although overcoming funding barriers may seem like an overwhelming obstacle for some families, there are many funding options available, including public and private resources. Insurance, grants, and private foundations may provide funding for communication devices. Another resource available to families may be their public school systems. The federal law, Individuals with Disabilities Education Act (IDEA), mandates the "purchasing, leasing, or otherwise providing for the acquisition of assistive technology devices by children with disabilities."

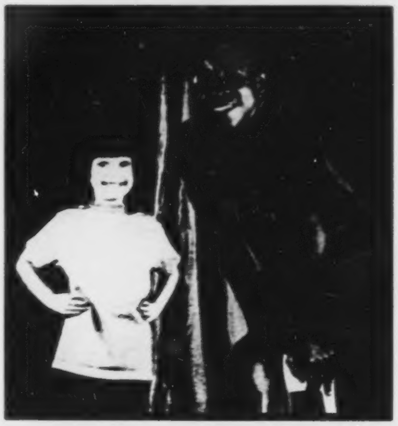
MEETING THE NEEDS OF THE FAMILY

During the assessment process, meeting the needs of the family is just as important

RESOURCES

An excellent resource of information for parents on the many devices currently available is the Communication Aid Manufacturer's Association (CAMA). CAMA hosts workshops in various parts of the United States throughout the year, highlighting the products of various AAC device manufacturers. They can be reached at (800) 441-2262.

Exceptional children deserve exceptional care.



The best help for cerebral palsy, spina bifida and related disorders is at Kennedy Krieger Institute.

For 61 years, Kennedy Krieger Institute has been the leader in helping children with severe disabilities. Focusing on early identification, intervention and treatment, our state-of-the-art interdisciplinary team approach—combined with a caring, supportive touch—has enabled generations of children to live their lives to the fullest.

Our comprehensive assessment and treatment for children with cerebral palsy, spina bifida and related disorders includes: Neurology, Medical Services, Nursing, Urology, Orthopedics, Physical Therapy, Occupational Therapy, Orthotist, Clinical Psychology, Neuro-Psychology, Seating, Feeding, as well as Rhizotomy, Spasticity and Movement Disorder clinics.

And unlike many programs, we see patients beyond age 18. Call Kennedy Krieger Institute today. We're here to help.

Circle # 47

as meeting the needs of the child. Understanding where families are in this process will have a powerful impact on the use of technology in the home. "A team approach to understanding, acceptance, and emotional levels would have been a huge factor with us as we learned about cerebral palsy," reflects Laura Warburg. "We needed to be led to the water instead of being told where the water was. We would have gained so much, in those early days *and* today, from one-on-one mentoring of a family with an older child with similar abilities. ACOLUG (Augmentative Communicator's Online Users Group) does that for me now."

The Warburgs (clockwise from top) Laura, Frank, Candice, and Joey

The Urschel family agrees that support from knowledgeable professionals and making the technology part of daily living is important. The greatest challenge we have faced is to actually implement the technology into our household and our lives. Eventually, we hope to act as a model for other families and attempt to pass on the basic concepts that we have learned so that everyone can benefit from our lessons," reflects Dr. Urschel. In spite of all these challenges, the Urschels, the Warburgs, and the Klauditzes all agree that being able to communicate with their children is the greatest reward. **EP**

National Association of Private Schools for Exceptional Children

Established in 1971, NAPSEC is a nonprofit association whose mission is to ensure access for individuals to private special education as a vital component of the continuum of appropriate placements and services in American education.

National Representation
NAPSEC advocates for the rights of children with disabilities and their families.

Nationwide Membership
NAPSEC represents private special education schools throughout the U.S., by providing a wide array of membership services.

Free Referral Service
NAPSEC provides information on potential placement options to parents and professionals who need an appropriate private special education setting for their child or client.

For additional information, contact:
Sherry L. Kolbe, Executive Director & CEO

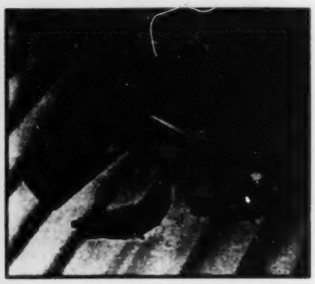
NEW PRODUCTS

PHONAK MICROLINK™

The Phonak MicroLink™ is a hearing aid accessory designed for use by children and adults with hearing disabilities. This wireless FM system provides additional amplification for individuals who use hearing aids, providing greater clarity in social situations and meetings, while conversing in an automobile, and while talking on the telephone or watching television. Compatible with computer-programmable hearing aids, the system is comprised of a transmitter that picks up the speaker's voice or other audio source and a small FM receiver that attaches to the user's hearing aid, delivering the sound directly to the user's ear. Volume is adjustable and the MicroLink has a range of 200 feet with a choice of transmitters: a lapel microphone, a boom microphone, or a handheld transmitter that can be set on a desk or table. The transmitter can also be plugged directly into a television, radio, telephone, or computer to reduce ambient noise.



Phonak, Inc., 4520 Weaver Pkwy., Warrenville, IL 60555-3927; (800) 679-4871; Web site: http://www.phonak.com

PHONICS-BASED READING™ AND READING S.O.S. (STRATEGIES FOR OLDER STUDENTS) FAMILY EDITIONS

Phonics-Based Reading™ and Reading S.O.S. (Strategies for Older Students) Family Editions are software programs designed for home use to teach reading skills to children, youth, and adults with dyslexia and other learning disabilities. Phonics-Based Reading teaches skills generally covered in grades one through three, introducing more than 2,000 words using engaging, age-appropriate graphics. Reading S.O.S. is intended for students from ages 9 through adult and covers skills generally taught in grades one through four. More than 3,000 words are introduced using a mature interface respecting the needs and interests of older students. Sold individually and available for Macintosh or IBM and compatible computers, both programs enable students to work independently at their own pace as voice prompts lead them through each activity.

Lexia Learning Systems, PO Box 466, Lincoln, MA 01773; (800) 435-3942; Web site: http://www.lexialearning.com

TOO HOT
TOO HOT

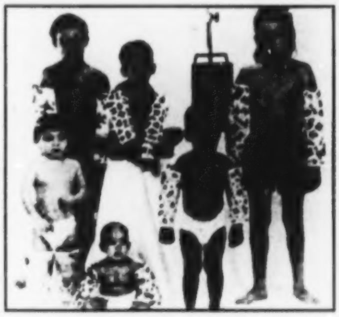
TOO HOT™ SPOONS

Too Hot™ Spoons change color when the food they are placed in reaches a temperature of 105 degrees or higher, reducing the danger of scalding. Made of non-toxic materials, these baby spoons are engineered so that when food temperature exceeds the limit, the color of the spoon bowl disappears entirely, leaving it white. The spoons also feature soft, flexible bowls to prevent injury to a child's gums; the solid, firm handle provides ease of use.

Questech International, Inc., 3810 Gunn Highway, Tampa, FL 33624; (800) 966-5367

PEDI-WRAPS™

Pedi-Wraps™ are soft arm and leg immobilizers designed to prevent children from reaching their faces after surgery, to prevent them from removing nasogastric tubes or IV lines, to prevent injury due to muscle spasms, or to provide stabilization during therapy. Made of soft, padded material, the wraps secure with Velcro and are available in sizes to fit premature infants through older children and come with or without thumbholes and shoulder straps, and in a model to accommodate IV lines. Leg Wraps™ are also available. Available in a variety of children's prints, Pedi-Wraps™ eliminate the institutional look of casts and pre-fabricated splints.



The Medi-Kid Company, PO Box 5398, Hemet, CA 92544-0398; (888) 462-3543; Web site: http://www.medi-kid.com

SWIM EAR®

Swim Ear® is a water removal and drying aid designed to relieve the symptoms and harmful effects of water trapped in the ear canal as a result of showering, shampooing, swimming, or water therapy. Applying several drops in the ear causes the water to be dislodged and run out or evaporate. The manufacturer notes this product should not be used in the presence of an ear infection, discharge, or perforated ear drum.

Remembering Devin

by Troy Huizinga

Pretend right now that you cannot walk or talk. You have both a visual and hearing impairment, and have seizures all the time.

I had an older brother named Devin who had all of these disabilities. A lot of people thought my brother could not do anything, that it would be weird to be his brother; but it was not like that at all. Devin was born with all his disabilities, and I cannot imagine him any other way. He could not walk, but I pushed him in his wheelchair. He could not speak, but I could understand him. I got used to his noises and faces, and sometimes, I would have to tell my parents what he wanted.

Devin swam, bowled, fished, camped, played hockey, and even went tobogganing.

As long as he had a life jacket and someone there to hold him, Devin was awesome in the water. He went bowling with his class and he would often have the highest score. A special wooden ramp was placed up to the wheelchair and the bowling ball was put into his hand. The ball then rolled down the ramp and if Devin was lucky...STRIKE!!

Devin liked to go fishing. He was better than me, of course. He had a lot more practice at sitting still and being patient.

Devin learned to play hockey at school. He would sit on a special sled-like seat with runners on the bottom. Someone would sit behind him to help him hold the hockey stick as they glided across the ice. Devin even scored a goal!

Devin went tobogganing, *once*. My dad laid Devin down on the toboggan and before we knew what happened, Devin was shooting down the slope with my dad charging after him! Devin looked like a bobsledder in the Olympics, and I have never seen my dad run that fast.

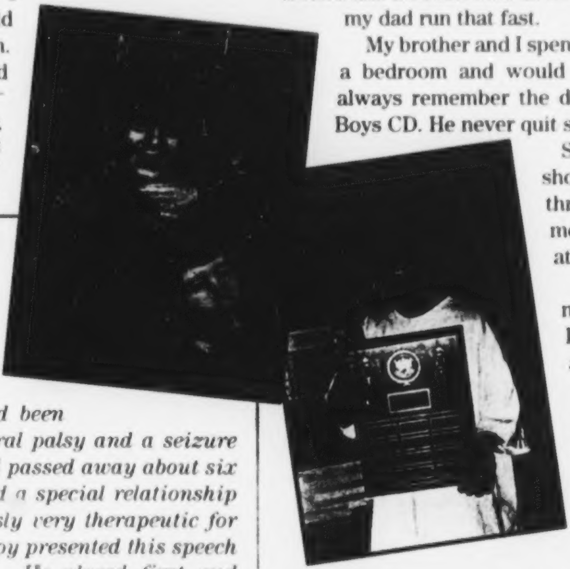
My brother and I spent a lot of time together. We shared a bedroom and would listen to music at night. I will always remember the day I bought our first Backstreet Boys CD. He never quit smiling!

Sometimes, when we would go out shopping and I would push Devin through the stores, it would make me angry when people would stare at him. I thought they were rude.

My brother Devin passed away not too long ago, and I miss him. Even with his disabilities, he did a lot.

With a little help, people can do anything! **EP**

Troy Huizinga, 10, lives in Ontario, Canada, with his mom, Joy, dad, Ken, and brother, Luke, 6.



(Top left) Devin at age 9 with his dog, Lucy. (Right) a Christmas portrait with Troy at age 3, and Devin at age 5. (Far right) Troy with his public speaking award.

Mom's Turn:

My son Troy's grade four class were asked to write a speech and present it. It was a surprise to find that Troy had written this speech about his older brother, Devin. Devin had been medically fragile (he had cerebral palsy and a seizure disorder) his entire life and had passed away about six months earlier. Troy always had a special relationship with Devin, and it was obviously very therapeutic for him to talk about his brother. Troy presented this speech in a school-wide competition. He placed first and eventually won first place at the Division Level. His most memorable event was when he was the guest speaker at a fundraising event. He received a standing ovation. Troy has helped the rest of our family deal with Devin's death through his wonderful story.

Now on the Web! *We will now be including Familiar Faces and Children's Page on our Web site, www.eparent.com Please send us your photographs with the understanding that doing so gives Exceptional Parent permission to put the photos on the Exceptional Parent Web site, exactly as they appear in the magazine and with the same text.*

The Children's Page welcomes contributions from children who have disabilities, their siblings, and their friends. Be creative! Send your stories, photos and/or artwork to: **Children's Page,** *Exceptional Parent,* 555 Kinderkamack Road, Oradell, NJ 07649-1517. **Be sure to include your name, address, and day-time telephone number!**

a
hard look at

When it comes to quality, **Otto Bock Rehab**® is an expert on the subject. Products such as the **Panda TRS Plus**®, with it's unique design, are leading the way in **quality, aethstetics, and growth adjustability**. The **Panda TRS Plus** is a lightweight, multi-functional tilt (up to 40°) and recline(up to 140°) mobility system that provides an optimal proportional fit for children with moderate to involved needs. Use the seating system and base for mobility, or add the seat to an optional home underframe for a variety of uses, ensuring years of use, guaranteed by a **5-year limited warranty**. **Panda TRS Plus**, is only one of the many **quality** made products by **Otto Bock Rehab**. Other products include the **Panda TRS**, a tilt and recline mobility system designed for children with mild to moderate needs, **Spee-Dee**® gait trainer, the **Lisa**® positioning mobility system, the **Sieger**® pediatric wheelchair, and **Busy Bee**®. **Panda TRS Plus** is just one more way that **Otto Bock Rehab** is helping to **make everyone's** life a little **easier**, and **more enjoyable**.

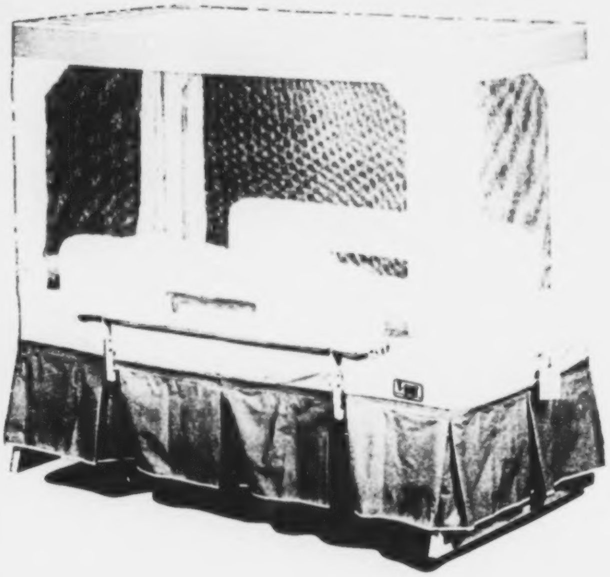
Sweet Dreams Start Here

"I didn't know what I was missing until now. Since my son received his Vail bed, I feel like a new person, and I have more energy to face the day. That's because Justin is sleeping better at night – and so am I."
Kimberly Spence
Mansfield, Ohio



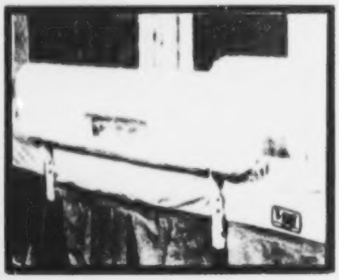
In a Vail 2000 Enclosed Bed

Now every special-needs child can enjoy the soft, non-threatening security of an enclosed hospital bed – while you enjoy peace of mind knowing that they are softly protected during the night.

Vail Enclosed Beds offer the protection of a soft, sturdy enclosure for:

- Fewer falls and injuries.
- Reduced wandering.
- More relaxed sleep—for your child *and* for you.

For convenience, Vail Enclosed Beds also accommodate medical equipment, fit all ages from child to adult, are frequently covered by insurance, and come complete with mattress, manually adjustabl hospital bed, lifetime service, assembly video and vinyl border and bedskirt. Patterned fabric Decorato Accessories are also available at an additional cost.



"Thanks for providing people with special needs a loving, safe, secure environment. Our Elizabeth Rose adores her new bed, and we feel good knowing she can't injure herself."
The Cesnik Family
St. Cloud, Minnesota

FOLLOW THE GOOD LIFE - WHEREVER IT LEADS!

The only bad question about carnitine deficiency is the one you don't ask.

Carnitine deficiency may affect as many as 375,000 children in the U.S. Unfortunately, it's hard to detect and often overlooked.

Carnitine plays a vital role in the production of energy. And when a child suffers from carnitine deficiency, he or she may have symptoms as subtle as developmental delay, frequent illness, poor muscle tone or slow weight gain. If Carnitor® can help your child, results may be dramatic.

Carnitor® is the only treatment for carnitine deficiency.

So ask your child's doctor about Carnitor® and contact us for more information at 1-800-447-0169.

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis, and seizures. There are no reported contraindications or warnings.

Carnitor
levocarnitine
Tablets 330mg • Oral Solution 1g/10mL

Please refer to the attached brief summary of prescribing information.

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY

The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY

CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 μmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS

In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE

CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS

None known.

WARNINGS

None.

PRECAUTIONS

General

CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.

Not for parenteral use.

Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility

Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY

Pregnancy Category B.

Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS

It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE

See Dosage and Administration.

ADVERSE REACTIONS

Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE

There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION

CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

OBS-2
2/00

All children should be seen. And heard.

With free Bell Atlantic assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Bell Atlantic. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Bell Atlantic customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

Bell Atlantic

Scott and Kerri Branson and their sons Luke and Zachary, who have cerebral palsy, live in Batavia, IL.

"We're a PediaSure® Family."

"PediaSure helps us give Luke and Zachary the nutrition they need."

All kids need proper nutrition for growth and development. So if your child is not getting enough of the right nutrition from regular food, ask your doctor about PediaSure®. Specially formulated for children, PediaSure is complete, balanced nutrition that provides balanced amounts of protein, fat, carbohydrate, vitamins and minerals. Look for PediaSure in your local supermarket or pharmacy.

PediaSure
Pediatrician Recommended

Available through WIC®*

*If your child has special dietary needs, check with your physician or local WIC clinic to see if your child is eligible to receive PediaSure through the WIC program. WIC is a registered trademark of the U.S. Dept. of Agriculture.

who use wheelchairs. Its extra-wide openings make it ready for most lifts. Its low floors make it easier to get inside. And its German engineering
lease a new EuroVan, and we'll refund up to $1500 of the cost of adding a lift and hand controls.* See your dealer for details.

EDITOR'S DESK

Mobility 2000

Mobility is a crucial part of the development of all children. Separating and becoming independent is a life long process that begins at birth. Physical limitations change the way independence develops. Over the past decade, there has been an enormous advance and improvement in mobility devices. This month, physical therapists Ginny Paleg and Steve Mauricio describe the use of self-propelled standers. These wheeled devices enable children to experience the feelings of stand and motion. Their article, "Stand and Deliver: Guide to self-propelled Standers" also contains a detailed evaluation of the devices that can help parents find their way through a thicket of standards and features and select what is most appropriate for their child.

Mobility can also be affected by intellectual as well as physical limitations. Travel training, which is included in the IDEA '97 (Individuals with Disabilities Education Act), helps individuals develop an awareness of the "outside" world and develop the skills to move effectively and safely from place to place. In "Travel Training: Getting out and about without fear," Margaret Groce, supervisor of the New York City Board of Education's Travel Training Program, discusses what parents can expect from the training and how it should be done to ensure safety and success for a child.

For many young people who use wheelchairs, getting to and from school or activities necessitates transportation in a van or bus. Only recently has serious attention been paid to the issue of correct positioning and securing of people who are being transported in their wheelchairs. In "New Developments in Safer Transportation for Wheelchair Users," Dr. Lawrence Schneider reviews the latest standards and pending mandates for wheelchair "tie downs" to ensure that occupants of wheelchairs are secured safely during the ride.

Our *Role Model* for April is Jim Jeffreys, a young man who was born without hips or legs. Jim is a wheelchair athlete and a graduate student at William Paterson University in Wayne, New Jersey. Jim succeeded in bringing the University community together to raise awareness about disability through a wheelchair basketball game that included athletes with and without disabilities. He and his family have inspired his fellow students and faculty at the University with their courage and persistence.

Critical findings on IDEA implementation

In January, the National Council on Disability (NCD) released a study on the implementation of IDEA in America's education systems. Parents who have written to EP with their experiences of having their child's educational needs denied will not be surprised by the pervasive problems the NCD found. Each state in the Union was found to be non-compliant with IDEA to some degree, and some have committed extensive violations of the law. The NCD recommended that the Department of Justice be involved in handling parental complaints and that the Department of Education establish and use national standards for evaluating each state's progress toward compliance.

Judy Heumann, assistant secretary of the U.S. Department of Education's Office of Special Education and Rehabilitative Services (OSERS), responded by discussing the great progress that has been made in the education of children with special needs. She indicated. that some of the problems described have been addressed and named a series of innovative programs that have been implemented. We have always been impressed by the dedication and ability of the OSERS staff and their commitment to IDEA and its implementation. However, over the past 20 years we have also been aware of consistent budget cuts in funding for monitoring of all federal programs, including OSERS. The shortage of monitors has allowed states and local communities to ignore their responsibilities; no matter the dedication of the OSERS staff, without the ability to monitor and enforce the laws, little will change.

Legislative update

Family Voices is an important parent organization which has made a significant impact on ensuring support for medical care for children with disabilities. This month, the group's National Communications Development Coordinator, Julie Keys, has written about the report "Your Voice Counts!" that Family Voices presented to Congress, and she has also reported on the pending legislation for this Congressional Session that affects people with disabilities and requires support.

Special technology

With technology changing ever more rapidly, many of us are at a loss to keep up with the information. Parents of children with disabilities cannot afford to be left in the dark about technology and what it provides. In "Assistive Technology 101," R.J. Cooper discusses the basics of what to look for when purchasing the computer equipment to support assistive technology.

Augmentative and alternative communication is a subcategory of assistive technology. In "Can We Talk." Part 3, Peggi McNairn and Cindy Shioleno continue their excellent series. This month, they look at choosing the system that is right for your child.

Maxwell J. Schleifer, PhD
Editor-in-Chief

Conference Calendar

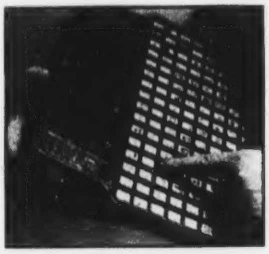
- EP is proud to be collaborating with the MassGeneral Hospital for Children on their conference and exhibit, Humanizing Health Care for Children and Families: The Art of the Relationship, which will take place in Boston, Massachusetts, May 28-31, 2000. Among the topics to be discussed at the conference are: family-centered care, community/school integration, spiritual care, and emotional support.

- This fall, EP will co-sponsor The World Congress & Exposition on Disabilities (WCD) (November 10-12, 2000 in Atlanta, Georgia). Come join us as we host this forum for individuals who have disabilities and their families, with leading experts on disability-related fields who will share their knowledge and experience. For more information, contact the WCD at: (877) 923-3976, or (201) 226-1446; Web site: http://www.wcdexpo.com

Communication

Start on the path to powerful communication.

Pathfinder® includes the right combination of features to be your best solution for voice output communications. It provides a vivid dynamic display with the stability of a fixed keyboard. This gives users quick access to core vocabulary, as well as the advantages of spelling and word prediction.



Pathfinder® incorporates Minspeak® brand software, the innovative, icon-based system used successfully by thousands of augmentative communicators.

Finally, Pathfinder® is compact, lightweight and rugged enough for everyday use. We'd be delighted to arrange for a demonstration, or call to ask for our latest catalog. Either way, you've started on the path to powerful communication.

EDITORIAL ADVISORY BOARD

EXCEPTIONAL PARENT

Parenting your child or young adult with a disability or special healthcare needs

EDITORIAL MISSION

- *To reach out to mothers and fathers of children and young adults who have disabilities and special healthcare needs.*
- *To empower parents and professionals by providing practical information and emotional support.*
- *To appreciate that parents are the most important experts in the lives of their children.*
- *To energize parents and professionals.*
- *To share ideas and experiences so parents, professionals, people who have disabilities, and other advocates can learn from one another and better collaborate to serve all children and families.*

There's a new hope for children

with

Cerebral Palsy and Brain Injury.

Recent evidence from around the world strongly suggests that hyperbaric oxygenation may be an effective therapy in treating Cerebral Palsy and the brain injured child.

The SPECT (brain activity) scans to the right demonstrate a potential recovery of dormant low oxygen brain cells responding to a high dosage of oxygen. This parallels a significant clinical improvement.

Search & Respond

Search and Respond is an opportunity for our readers to exchange information about their practical experiences in meeting the everyday challenges of life with a child or adolescent who has a disability. In this column, "S" represents Search letters and "R" represents Respond letters received to a previously printed Search. "Instant S&R" is a new feature which represents e-correspondence we have downloaded from our Web site. All Responds are forwarded to the writers of the original Searches; some are published. Published letters may be edited for purposes of space and clarity. We also expect parents to consult appropriate professionals.

When sending correspondence, please indicate whether it is a Search or a Respond. For Responds, be sure to note in which issue the original Search letter appeared. Please remember to include a phone number on all correspondence, in the event that more information is required. Write to: Exceptional Parent, Attn: Search/Respond, 555 Kinderkamack Rd., Oradell, NJ 07649-1517; Fax to: (201) 634-6570; E-mail to epedit@aol.com; or visit Search and Respond on our Web Site: http://www.eparent.com.

For information about specific disabilities, contact: the National Organization for Rare Disorders (NORD), 100 Rt. 37, PO Box 8923, New Fairfield, CT 06812; (800) 999-6673; (203) 746-6518; Web site: http://www.rarediseases.org. Also, see the "National Resources for Specific Disabilities" directory in Exceptional Parent's 2000 Resource Guide (January 2000, starting page 30).

Each month, Chris Feudtner, MD, PhD, reviews Search & Respond for accuracy and completeness. Dr. Feudtner is a pediatrician at the Pediatric Care Center of the University of Washington in Seattle, and is currently a Robert Wood Johnson Clinical Scholar. Look for Dr. Feudtner's comments on certain Search & Respond letters.

S Chromosome 13q- syndrome

I work in an early-intervention program, and I am seeing a family whose 14-month-old son was recently diagnosed as having Chromosome 13q- syndrome. (This is a rare disorder in which part of the long arm of the 13th chromosome is missing. It is characterized by craniofacial malformations, limb abnormalities, poor growth, and psychomotor delays). The child is at increased risk for developing retinoblastomas (cancerous tumors of the eye) before age 5 and osteosarcomas (cancerous tumors of the bone) after age 8. He has already had one retinoblastoma removed. The baby is globally delayed (functioning at about half his chronological age), but he is improving. The family is eager to communicate with other families who have a child with chromosome 13q- syndrome, especially in Colorado or the western US.

R. S., Grand Junction, CO

EDITOR'S NOTE: You may want to contact Chromosome Deletion Outreach, Inc., PO Box 724, Boca Raton, Fl [illegible]3429-0724; (516) 391-5098; E-mail: [illegible]worldnet.att.net; Web site: http://mem[illegible]rs.aol.com/cdousa/cdo.htm; or the National Retinoblastoma Parent Group, PO Box 317, Watertown, MA 02471; E-mail: napvi@perkins.pvt.k12.ma.us.

Swallowing

S My 4-year-old son is undiagnosed after genetic testing, an EEG, and an MRI. He is delayed in all motor skills and speech. He also has a high-arched palate and receding chin. We had a G-tube inserted because he is not able to swallow. He has been seen by occupational and speech therapists, but neither has helped him with swallowing. He is making improvements in the other areas of development, but I am at the end of my rope with the swallowing. Any information would be helpful.

L. C., via the EP Web site

Genetic syndrome?

S I have two sons with special health needs. My 9-year-old son has cerebral palsy and periventricular leukomalacia (white matter volume loss and immature myelination). Now my previously healthy 2-year-old son has been diagnosed with myoclonus (a neurological movement disorder characterized by sudden, involuntary contractions of the skeletal muscles). I am wondering if my two sons' problems are related. I am looking for more information about myoclonus and whether there are any treatments besides medications. I would also appreciate information on programs in New York that will help us adapt our home and purchase equipment for the boys.

A. B., New York, NY

S Patterson-Lowry rhizomelic dysplasia

My 10-year-old son was diagnosed as having Patterson-Lowry rhizomelic dysplasia (a rare skeletal disorder that is characterized by shortening of the long bones, especially the arms; coxa vara, where the thigh bone is angled toward the center of the body; short stature; and limited shoulder motion). We have encountered many medical problems including: epilepsy, learning problems, coxa vara that required surgery, and dyspraxia (difficulty performing tasks that require coordination). We are not sure if he has been diagnosed correctly and would appreciate any information.

L. T., LaCrosse, WI

Dr. Feudtner: *You may wish to discuss with your physician the possibility of a consultation at a major center that deals with rare chondrodysplasias.*

EDITOR'S NOTE: You may want to contact the International Center for Skeletal Dysplasia, Saint Joseph's Hospital, 7620 York Road, Towson, MD 21204; (410) 337-1250.

S Custom buggy

I have a 7-year-old daughter who has cerebral palsy, microcephaly, and epilepsy. I recently found out that I am pregnant. I will desperately need a double buggy to transport both children. My older daughter requires good support due to her physical problems. I have tried everywhere here in the UK and have not come up with any possibilities. I would appreciate any advice or contacts, even in the States.

Elaine, via the EP Web site

AGE APPROPRIATE BEDS

For when your child passes the crib stage!

Dianna Fitzgerald & Her Son Nicholas

The Stockton features full crib safety sides

Beds for children once they pass the crib stage are always an issue with parents... I can't begin to tell you how terrific the people at HARD Mfg. are. Mary Bias, the rep for the Indiana area told me she knew exactly what I wanted and needed for Nicholas. Thirty-days later the Stockton Bed arrived and it couldn't be more perfect! The Stockton comes in three sizes, with crib type rails, and a height adjustment up to 34"...saving my back! It even has a mounted IV pole for Nicholas' feeding pump. Mary had also suggested the white bed with a red outer footboard and yellow inner headboard...

It truly is the best investment we ever made.

Thank You HARD!
Dianna Fitzgerald

- HARD "Age Appropriate" Beds accommodate your child with the safety and convenience you would expect from the nation's #1 manufacturer of hospital cribs and youth beds.
- Available in a rainbow of colorful epoxy finishes and laminate colors to match your room decor.
- Hi-Lo adjustment for convenience and safety.
- Attains all orthopedic and comfort positions.
- Currently available in custom sizes to accommodate all ages.
- Crib type safety sides are close to the mattress to protect arms & legs.

S Portable potty

My ten-year-old daughter has cerebral palsy, is non-ambulatory, and cannot talk. When we go to use public restrooms, it is very difficult for me as her caregiver to constantly hold her on a regular toilet bowl. I am in search of a portable potty that can be placed on a regular-sized toilet bowl—one that has sides (so she will not fall over) and is foldable (to fit in a dia per bag).

J.S., via email

R Probable mitochondrial metabolic disorder

H.H., December 1999 (via the EP Web site), has a son who is undiagnosed. He has feeding difficulties, a seizure disorder, developmental delay, and a high level of lactic acid in the blood. She requested information on further testing to help determine a diagnosis, and also wanted ideas on seizure medications that would not make the mitochondrial disorder worse.

My 2-year-old daughter has the same symptoms and was diagnosed with a peroxisomal disorder. (Peroxisomes work to rid the body of toxic substances.) She has some characteristics of infantile Refsum syndrome (a rare disorder of lipid, or fat, metabolism) and some of neonatal leukodystrophy (a rare, progressive, genetic metabolic disorder that affects the brain, spinal cord, and nerves). My daughter is also like a 6-month-old. She cannot walk, talk, or sit up. Her head control is still poor, and she suffers from seizures as well. She is currently on liquid Depakote®, which has reduced the length of time of the seizures from 20 to 7 minutes (approximately). My advice is to ask your doctors to consider a skin biopsy before a muscle biopsy (so as to be less invasive), and to check the blood levels of the "very long fatty acids" that accumulate in people who have peroxisomal disorders.

Dolores, via the EP Web site

R Respite Care

Marcy, Feb 2000 (via the EP Web site), requested information on obtaining respite care for her two children with severe disabilities. Her family lives in Michigan.

Contact your local community mental health (CMH) board. They should be listed in the phone book in the government section. Respite is an important area for families with children with special needs, and great efforts have been made in funding for respite. In our county, respite is available about every 6 weeks. The CMH may also have funds for home nursing. Check with your insurance first, as many good policies will cover this need, particularly if one spouse has to travel for his or her job.

Clay, via the EP Web site

Instant S&R

S Undiagnosed

I have a 20-month-old daughter with severe delays. She has a heart defect, uncoordinated swallowing (she is fed via a G-tube), growth deficiency, short limbs, simian crease (a single crease across the palm) on right palm, reflux, and neurological issues. All tests, including chromosome tests, have come back normal. We would love to know more about her future.

Amy, via the EP Web site

R Undiagnosed

I have a 9-year-old daughter who is severely mentally impaired. She functions at about the level of a 2-year-old. At birth, she had several defects including: cleft palate, missing thumbs on both hands, chromosome translocation (portions of the chromosome are broken and attach to other chromosomes) of 1 and 16, heart defects, feeding disorder, and gastroesophageal reflux disease. She has some hearing loss, but even so is hypersensitive to sound. She is tactile defensive. She also had the simian crease in both hands. At 4 months of age, she had her cleft palate repaired. At 7 months, she had her index fingers turned into thumbs (they look and work wonderfully well!) She has a G-tube and has had two fundoplications (construction of a new "valve" between the stomach and the esophagus) to stop the reflux. She has Barrett esophagus (chronic inflammation of the esophagus due to reflux). We have been to several doctors and clinics with no diagnosis or syndrome named.

My daughter is a happy child who loves to wrestle and give kisses. We do not know what her prognosis will be in the future, so we treasure each day we have with her. It has been a difficult and long 9 years. All I can offer you is to love your daughter for what she is and not to worry about what she is not. It is hard for me not to feel sorry for my daughter or myself, but my pediatrician has a great way of putting it. He says that in my daughter's world she is the happiest kid on Earth, and he is right. We try to focus on the things that she has learned to do and pray that she continue learning the small things. If anyone has a child similar to our daughter, we would also appreciate any advice or support you can give.

Mary, via the EP Web site

CPSC and National SAFE KIDS Campaign announce crib safety initiative

The US Consumer Product Safety Commission (CPSC) and the National SAFE KIDS Campaign announced a crib and play-yard safety initiative to keep children safe when traveling with their families. Recent spot checks by SAFE KIDS found unsafe cribs and play yards in 80 percent of the 90 hotels and motels visited throughout 27 states and the District of Columbia. Of the cribs inspected, 82 percent had at least one safety hazard including loose hardware or lack of a secured mattress. Of the play yards and mesh cribs inspected, 52 percent had at least one safety violation.

CPSC and SAFE KIDS have prepared information that hotels and motels, as well as consumers, can use to make sure cribs and play yards are not hazardous. The crib and play-yard safety inspection checklist and CPSC crib safety and recall information are

CALENDAR OF EVENTS

MAY 4-7

International Parent to Parent Conference 2000
"Pioneering Spirit Blazing New Trails"
RENO, HILTON, RENO, NV

This conference brings together families from across the United States and all around the world. Topics will include support, education, medical and health issues, and the Parent to Parent philosophy. For more information call (775) 747-1771; Web site: http://www.unr.edu/repc/npm.

MAY 6-7

18th Annual Cincinnati Wheelchair Games and Sport Expo
CINCINNATI, OH RECREATION COMMISSION, DIVISION OF THERAPEUTIC RECREATION
SYCAMORE HIGH SCHOOL, 7400 CORNELL RD., CINCINNATI, OH

Events will include swimming, track and field, triathlon, vendor booths, wellness seminars, and more. For more information call Heidi Bunker at (513) 352-4056.

MAY 12-14

Abilities Expo
ANAHEIM CONVENTION CENTER, ANAHEIM, CA

This conference will show the latest in assistive living products and services, as well as seminars on insurance coverage, government regulations, and available services. For information call (800) 382-3085, Web site: http://www.abilitiesexpo.com.

MAY 12-16

Advancing Children's Health 2000
Pediatric Academic Society and American Academy of Pediatrics
HYNES CONVENTION CENTER, BOSTON, MA

Topics will include ADHD: Guidelines for Office Practice and advocacy training. For more information, call (281) 419-0052; fax: (281) 419-0082; Web site: http://www.aps-spr.org.

MAY 12-19

American Occupational Health Conference
PENNSYLVANIA CONVENTION CENTER, PHILADELPHIA, PA

Topics will include The Future of Health Care: Debating the Issues and The Impact of the Complete Human Genome. For more information call (847) 818-1800 or go to their Web site at http://www.acoem.org.

MAY 22-24

Nursing Care of the Hospitalized Child
NEW ORLEANS, LA

This conference is for pediatric nursing professionals who care for children. Goals of this conference are to strengthen advanced physical assessment skills, understand the psychological impact of illnesses in the lives of children and families, and exchange ideas and approaches with colleagues. For more information call (925) 828-7100 x0.

MAY 28-31

MassGeneral Hospital for Children Conference 2000
"Humanizing Healthcare for Children and Families: The Art of the Relationship"
WESTIN HOTEL COPLEY PLACE BOSTON, MA

The goal of this conference is to provide individuals with a forum to come together as advocates for children and families. For more information call (617) 724-5720.

MAY 25-28

The 6th National Conference on Hydrocephalus for Families and Professionals
LA POSADA RESORT, SCOTTSDALE, AZ

Topics will include trends in research, comprehensive pediatric care, complex hydrocephalus and Dandy-Walker syndrome, and alternative treatments. For more information contact the Hydrocephalus Association at (888) 598-3789; Fax: (415) 732-704; Web site: http://www .hydroassoc.org; or E-mail: hydroassoc@aol.com.

MAY 30-June 2

Association for the Care of Children's Health, 34th Annual Conference
"Kids Need More Than Medicine to Get Well"
HYATT REGENCY, LONG BEACH, CA

Topics will include pediatric pain awareness, learning to enhance healing through the family, using imagery and meditation for stress and pain reduction. For information call (562) 933-8050.

MAY 30-June 3

American Association on Mental Retardation 124th Annual Meeting
HILTON, WASHINGTON, DC

Topics that will be discussed are ethics, genetics and self determination. For more information call (800) 424-3688; Web site: http://www.aamr.org; or E-mail mward@ aamr. org.

Just This Side of Normal: Glimpses Into Life With Autism

BY ELIZABETH KING GERLACH

Published: 1999, Four Leaf Press. 139 pages.

Available through the EP Library: (800) 535-1910: code FL101AT.

Cost: $19.95 plus shipping and handling.

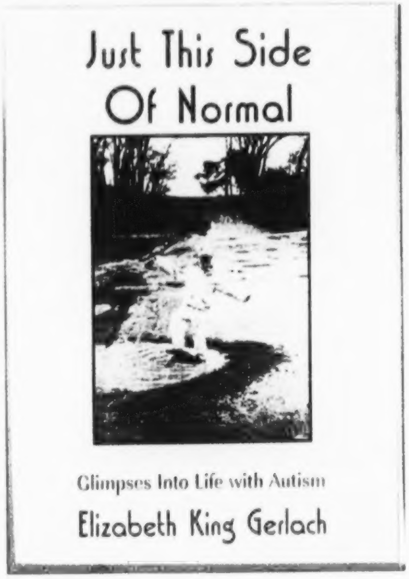
In the pages of her recently published book, Elizabeth King Gerlach, author of *Autism Treatment Guide* and founder of the parent advocacy group, Mothers From Hell, shares a very personal account of life with her son Nicky, 12, who has autism. *Just This Side of Normal* is a story told through brief episodes Elizabeth recounts, some revolving around the trials and stresses of caring for Nicky, and some celebrating breakthroughs that served to renew and deepen the bonds between parent and child.

One example of the heart-wrenching emotions that a parent of a child with autism experiences is captured in passages like this:

"Every time I give Nicky a kiss he wipes it away with his hand as if it were repulsive. I know it isn't me; I know it is a 'sensory issue' or a 'compulsive act,' more features of autism. Understanding doesn't make this small act hurt any less.

One day I blurt out, 'Please don't wipe my kiss away, rub it in and make it stay.' Something about the rhyme makes him laugh. Something in him is freed up. Perhaps he understands the importance the kiss carries for both of us. Perhaps he wants to oblige me in this small happiness?

'Kiss me again,' he insists. The hand brushes up to the cheek in the usual fashion, but this time he smiles and says, 'I rub it in and make it stay. Kiss me again.'"



Advocating for their child's rights in school is another facet of life for parents of children with disabilities. Elizabeth describes her experiences in the front lines, attending her son's school Individualized Education Plan (IEP) meeting. The meeting includes seven school-district personnel. Elizabeth feels it is imperative that Nicky remain where he is. He is comfortable and familiar with the school, and has been improving. She feels uncomfortable and intimidated:

"I wonder how often the administration banks on this subconscious fear and feeling of inadequacy, and on the lack of power the typical parent like me must feel. We are so very out of place. Neither a student nor a teacher. Our children are viewed as 'problems.'

The tester removes his glasses and runs his fingers over his eyes as though he has a headache. He has tested my son's cognitive skills. He has administered the test without consulting us as to what might have been used (stickers, M&Ms...) to motivate Nicky to answer the questions. We wanted Nicky's scores to reflect his usual cognitive abilities, not his ability to 'test.'

'The results,' he informs me, shaking his head, 'would indicate that your son is a nonreader.' He drones on for another twenty minutes, finishing with the pronouncement, 'Your son's placement at this school has been a failure.'

Shock and rage boil inside me like lava. I erupt.

'My son has learned how to walk in a line, he has learned how to raise his hand, he has learned how to sit in class, he no longer runs away, he has participated in school performances. How dare you call my son's time here a failure!' I hardly believe my own voice. I am shaking. The insensitivity of this man is the last straw. Having just completed a special education law class this term, I quote the 'stay put' provision, which guarantees a parent's right to appeal any decision regarding a change in their child's placement.

The atmosphere in the room changes. The teacher is in tears. The principal assures me that it can be worked out. This seems like a bad dream."

At the end of the book, Nicky is 12 years old. Elizabeth reflects during the rare quiet time of early morning while looking in on her sleeping sons:

"I wouldn't, couldn't, have imagined the complexities of mothering a child with autism—the struggles, the heartaches, the opportunities to learn and love. Once these boys were only the dream of a girl who wanted to be a mother. Now they are two living 'wishes come true,' with wishes of their own. What new dreams and possibilities are yet to be for them?"

Excerpts reprinted with permission from the author.

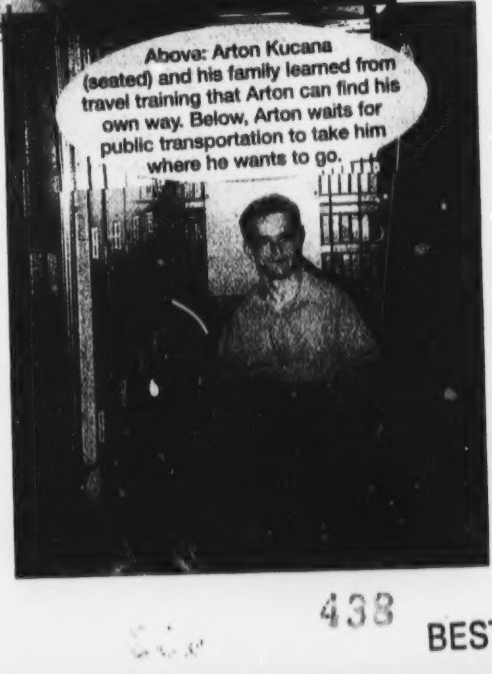
TRAVEL TRAINING: GETTING OUT AND ABOUT WITHOUT FEAR

Independent mobility in the community—the ability to safely navigate public places and use public transportation to get to school, a job, or to visit a museum or a friend—is a basic part of enjoying life. Too often, however, it is an option that is overlooked or dismissed as too dangerous for young people with disabilities. The good news is that the skills needed for successful self-directed travel can be taught and the need for this training is recognized under IDEA.

By Margaret M. Groce

Margaret Groce supervises New York City's Board of Education District 75 Travel Training Program. For 30 years, the Program has been responsible for training many students to get around in one of the biggest, busiest cities in the world. In this article, she describes what a parent can expect from a good program and how young people with disabilities can learn to safely travel wherever the road, and their dreams, will take them.



Above: Arton Kucana (seated) and his family learned from travel training that Arton can find his own way. Below, Arton waits for public transportation to take him where he wants to go.

Having the ability to travel independently and at will provides a vital key to achieving participation in society. For young people with disabilities, travel training is a way to gain the necessary skills to travel on their own. Travel training is specially designed instruction provided to students with disabilities (other than blindness or visual impairments) to enable them to safely negotiate public environments and use public transportation as independent travelers. In addition to its contribution to independence, travel training also has financial benefits since the cost of using public transportation is significantly less than that of using a contracted private car or bus service.

How is travel training provided?

The instructional program is short-term, comprehensive, and individualized to the student's needs and abilities. The training is one-to-one and takes place in the natural environments in which the student is expected to travel.

Most students start travel training at about the age for transition: between 15 and 21. Some children may be ready for training at an earlier age, however. Younger students and those who are not ready to learn to travel independently may require additional instruction in basic mobility and travel-related skills and concepts.

Taking the first steps:

In the District 75 Travel Training Program, a summer component aims to provide purposeful movement and basic mobility/travel skills. Examples of these skills include: moving through a school building independently; waiting in line; self-identification (how to identify oneself to appropriate officials and get any assistance needed); opening doors; walking on the right side of the hallway; reading signs; following environmental cues (such as sounds, smells and colors that indicate where one is and what one should do. For example, the sound of a fire alarm indicates that one needs to leave the building, and not wait for a teacher to say, "Line up."); using an elevator; and using telephones.

BEST COPY AVAILABLE

This instruction in basic mobility and travel-related skills generally occurs in small group settings in a classroom. During this instructional program, the concept and experience of traveling in the community and using public transportation is introduced with an emphasis on the skills and behaviors needed for safety.

Independent travel:

Before beginning travel training, the students are assessed on functional, cognitive, physical, and behavioral skills related to travel, such as: "initiating" actions (how to know when it is time to cross the street), self-identification, and using money. In addition, students must have a good understanding of and ability to use basic skills such as: knowing where their personal space ends and that of others begins; an awareness of their environment; and the ability to recognize and respond to danger. If the assessment indicates that the student can profit from travel training, parental permission and student consent for the instruction and independent travel is then secured.

Hitting the road:

Following the assessment of the student, a travel route is selected from the individual's home to the destination point and back to home.

Choosing the best route:

One-to-one instruction is individualized to meet the needs and preferences of the student and family. Selecting the appropriate route for the individual is

Student Greg Lawrence (front) learns to cross the street with travel trainer Fontessa Cole.

TAKING IT TO THE STREETS

Parent experiences with travel training

"Getting Eron to school was very difficult," writes Helen Lewis, a parent in New York City, whose son Eron, 17, has developmental disabilities. According to his mother, Eron could not be allowed to walk anywhere unaccompanied and did not like the school bus. "I had to take him to and from school with very little time for other things." Though Mrs. Lewis did not see a way out, the Travel Training Program of District 75 was able to provide the answer. "At first I was very skeptical about Travel Training," she writes. Mrs. Lewis' concern is common among parents, especially those whose children have cognitive impairments. The suggestion that their child with disabilities learn to travel independently and use public transportation creates anxiety and fear among many parents.

Underlying parents' fears is their belief that their children are too vulnerable to travel independently. At the same time, parents want their children to grow up to be as independent as possible. In order for this dream to become reality, their children need to acquire the essential skills and behaviors, including the use of public transit. That's where travel training by skilled professionals comes in.

Mrs. Lewis agreed to let Eron try the Program and was impressed with its trainers. "From the very first moment Gerard came to my door he was very professional in the way he took charge of the situation. He spoke to Eron in an authoritative way. I didn't expect it but Eron listened to him. Right there and then I knew I was doing the right thing. In a matter of days I realized that the possibility of Eron traveling by himself was becoming a reality."

Now, Mrs. Lewis notes, her son insists on going to school by himself and even travels to the corner store. "I have seen a big change in him—in his schoolwork and his confidence. Eron has become so independent that sometimes I forget he has a disability."

Joseph Scimeca negotiates the NYC subway system in his manual wheelchair.

continued from page 27

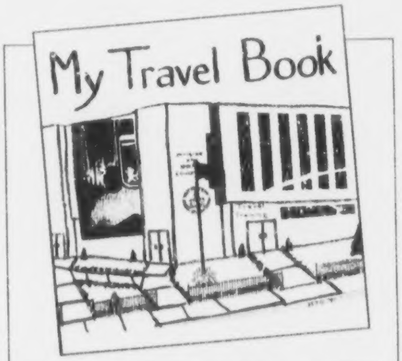
an important part of the instructional plan. Some families might not want their child using the subway system or may not want the child to travel down a certain street or on a side of a certain street. The travel route is evaluated to determine the safety and suitability of the environment for the student including social conditions, type of neighborhood, availability of shelter, traffic, intersections, distance, time, and transit options. The time of day of actual travel for the student is important. A route may be safe and suitable during rush hour travel but not at off-peak times.

The one-to-one instruction occurs at the time the student will usually travel. This enables the travel trainer to evaluate the student's ability to handle the actual travel environments safely and make modifications or changes in the route if necessary. Travel training typically begins at the student's home in the morning and ends at the same place later in the day.

Travel essentials:

Every student receives intensive instruction in essential travel skills with the opportunity to practice the skills in the natural environment of travel. Essential travel skills include: crossing streets safely, with and without traffic signals; responding appropriately to strangers; knowing what to do if lost or disoriented; requesting assistance from an appropriate source (and declining assistance from inappropriate sources); recognizing and avoiding danger or obstacles; using the telephone or other systems of communicating; dealing with unexpected situations in the travel environment; boarding, riding, and exiting the appropriate transit vehicles; recognizing and disembarking at the correct destination; maintaining appropriate behavior; and having the ability to make decisions and follow directions.

Last year, 17-year-old Elliot Sarlo, who has autism, participated in the District 75 Program and learned to travel alone on public transportation from his home to school, both in the borough of Bronx, New York. This year Elliot has learned to travel to a neighboring borough, Manhattan, to his new high school. According to his mother, Julie, the travel training team was very supportive and worked to build on Elliot's strengths: "They never saw my son's autism as a barrier. When he made mistakes, like missing his stop on the bus or subway, or getting



Students in the District 75 Travel Training Program make their own Travel Booklets using photos and other images to help them reinforce landmarks and directions on their way to school, home, or other activities.

WHAT YOU SHOULD KNOW ABOUT YOUR TRAVEL TRAINING PROGRAM

When investigating travel training programs, one should review the training procedures each program offers or look over the training provided by your child's school. Although a national movement to establish travel training standards is underway, no standards presently exist. To determine the quality of the program available, you might want to ask some of the following questions.

*What kind of training have the travel trainers had?
*Does the travel trainer have experience working with students who have the same or similar disabilities and needs as your son or daughter?
*Who supervises the travel trainer?
*What are the safety policies for this program, and what safety skills are taught to the student?
*How does the travel trainer communicate with the school and with the family? How often?
*Are students' records maintained in a professional and confidential manner, in conformity with the IEP (Individualized Education Plan) requirements?
*How much time is spent with travel training in the classroom? How much time in actual travel?
*How is student progress evaluated, and what are the criteria for independent travel?
*Can you be put in touch with someone who has completed this training program?

Reprinted courtesy of National Information Center for Children and Youth with Disabilities (NICHCY) from their publication "TRAVEL TRAINING FOR YOUTH WITH DISABILITIES." For copies, contact NICHCY at (800) 695-0285 (Voice/TT) or visit their Web site: http://www.nichcy.org.

off at the wrong one, they showed him how to problem solve and deal with these situations. They taught him the responsibility of independence, the self-reliance to handle himself on the street with confidence." The ability to read, tell time, and do math are not mandatory for independent travel, and no individual should be denied training if lacking these skills. A good travel training program makes use of a student's abilities, while taking into account his or her disabilities.

Students are given the opportunity to generalize skills by traveling alternate routes during the instructional program. The instructional program concludes with a post-assessment of the student's travel skills using a "following" procedure. This is conducted by having a travel trainer who is not known to the individual follow close enough to ensure the student's safety while assessing the performance of travel skills when the student believes he or she is traveling alone.

The "following" procedure is a critical part of the success of the training program. Mrs. Sarlo agrees, "The travel trainers shadowed Elliot to and from school, and tested him by coming up to him in the street, asking him for money or personal questions. These things are so important to his learning how to handle the City on his own."

At the conclusion of the instructional phase of program, the "following" procedure provides the basis for written recommendations, documenting the student's ability to travel safely and independently. The recommendations are then given to the student, the family, and the school.

Student progress is communicated to the parents daily. For travel instruction to be effective there needs to be respect and trust between the travel trainer and the family. Parents need to be assured that there will be no recommendation for independent travel if there is a question of student safety.

Daily communication helps build that trust and prepare parents for the day when the instructional program is over and their son or daughter will be traveling independently. Based on the

On His Way To A Brighter Future

Michael is an inquisitive boy with mental retardation. His behavior kept him from making progress in public school. His frequent hitting, biting, and noncompliance pulled him further and further behind, and no one knew how to get him back on course.

When he came to Heartspring School at the age of 10, we started by getting to know him as an individual. His interdisciplinary team gathered data on his behavior in every situation, throughout the day. We documented causes and correlations.

Patterns began to emerge. Michael's toughest challenges, it turned out, lay in making transitions between tasks, so we provided him with structure and predictability. He was a boy of many hobbies, so we reinforced appropriate behaviors with rewards that reflected his personal interests. He had fallen into a cycle of frustration that tended to snowball out of control, so we taught him practical strategies dealing constructively with his anger.

Now, just over a year later, Michael is realizing a fuller potential. He's happier. His frequency of problem behaviors has dropped from 85 percent to nearly zero. He's returned to public school – and is once again moving forward with his life.

If you know a child who could use some help getting back on course, call Heartspring School.

Circle #21

IDEA and Travel Training

Recognizing the importance of self-directed travel, Congress addressed the issue of travel instruction in the reauthorization of the Individuals with Disabilities Education Act (IDEA) of 1997 and the Rehabilitation Act of 1998. Travel training, which is now a part of the amended IDEA's definition of special education, differs from orientation and mobility services, which are related services under the IDEA.

In IDEA '97, travel training was included in the amended definition of special education. The nation's public schools now are required to provide travel training "to children with significant cognitive disabilities, and any other children with disabilities who require this instruction, to enable them to -

(i) Develop an awareness of the environment in which they live; and

(ii) Learn the skills necessary to move effectively and safely from place to place within that environment (e.g., in school, in the home, at work, and in the community)."

Likewise, the Rehabilitation Act Amendments of 1998 also recognized the importance of learning to travel and to use public transportation in getting and keeping a job. The law requires vocational rehabilitation agencies and independent living centers to make travel instruction available to their consumers needing this service. This means that children receiving special education services will have the opportunity to receive instruction in basic mobility and independent travel skills, and the use of public transportation where appropriate, as part of their education programs.

continued from page 29

results that her son achieved through the District 75 Program, Julie Sarlo credits travel training and the responsiveness of the trainers: "He now walks taller, has more confidence, has more freedom, and has made us all proud. For each gain Elliot makes I feel like another door opens for him. The travel team provided him with a very special door, one that has opened on a world of possibilities."

Who are qualified providers of travel instruction?

The trainers are paraprofessionals, who have received extensive training in practices, procedures, and strategies necessary for teaching students with disabilities to travel on public transportation. These paraprofessionals are supervised by travel training teachers.

The competencies and standard for travel training professionals can be found in the monograph, "Travel Instruction for People with Disabilities: A Standards and Curriculum Development Project (1998)" available from Project ACTION and at the following URL: http://www.wmich.edu/hhs/blrh/html/blrh.htm. Currently, travel instruction personnel receive pre-service training in the identified competencies at a school or adult service agency before being considered qualified. It is expected that personnel preparation will be developed at the university- and college-affiliated programs in the future. **EP**

Margaret M. Groce is the Supervisor of the Travel Training Program, District 75. In the New York City Board of Education, special schools for students with moderate, severe, and profound disabilities are administered by the District 75 Superintendent. The Travel Training Program of District 75 provides travel instruction to students with disabilities other than blindness or visual impairments. Since 1970, approximately 9,000 students have received one-to-one travel instruction, and 86 percent successfully became independent users of public transit. The majority of the students had significant cognitive impairments and would be classified as having moderate mental retardation.

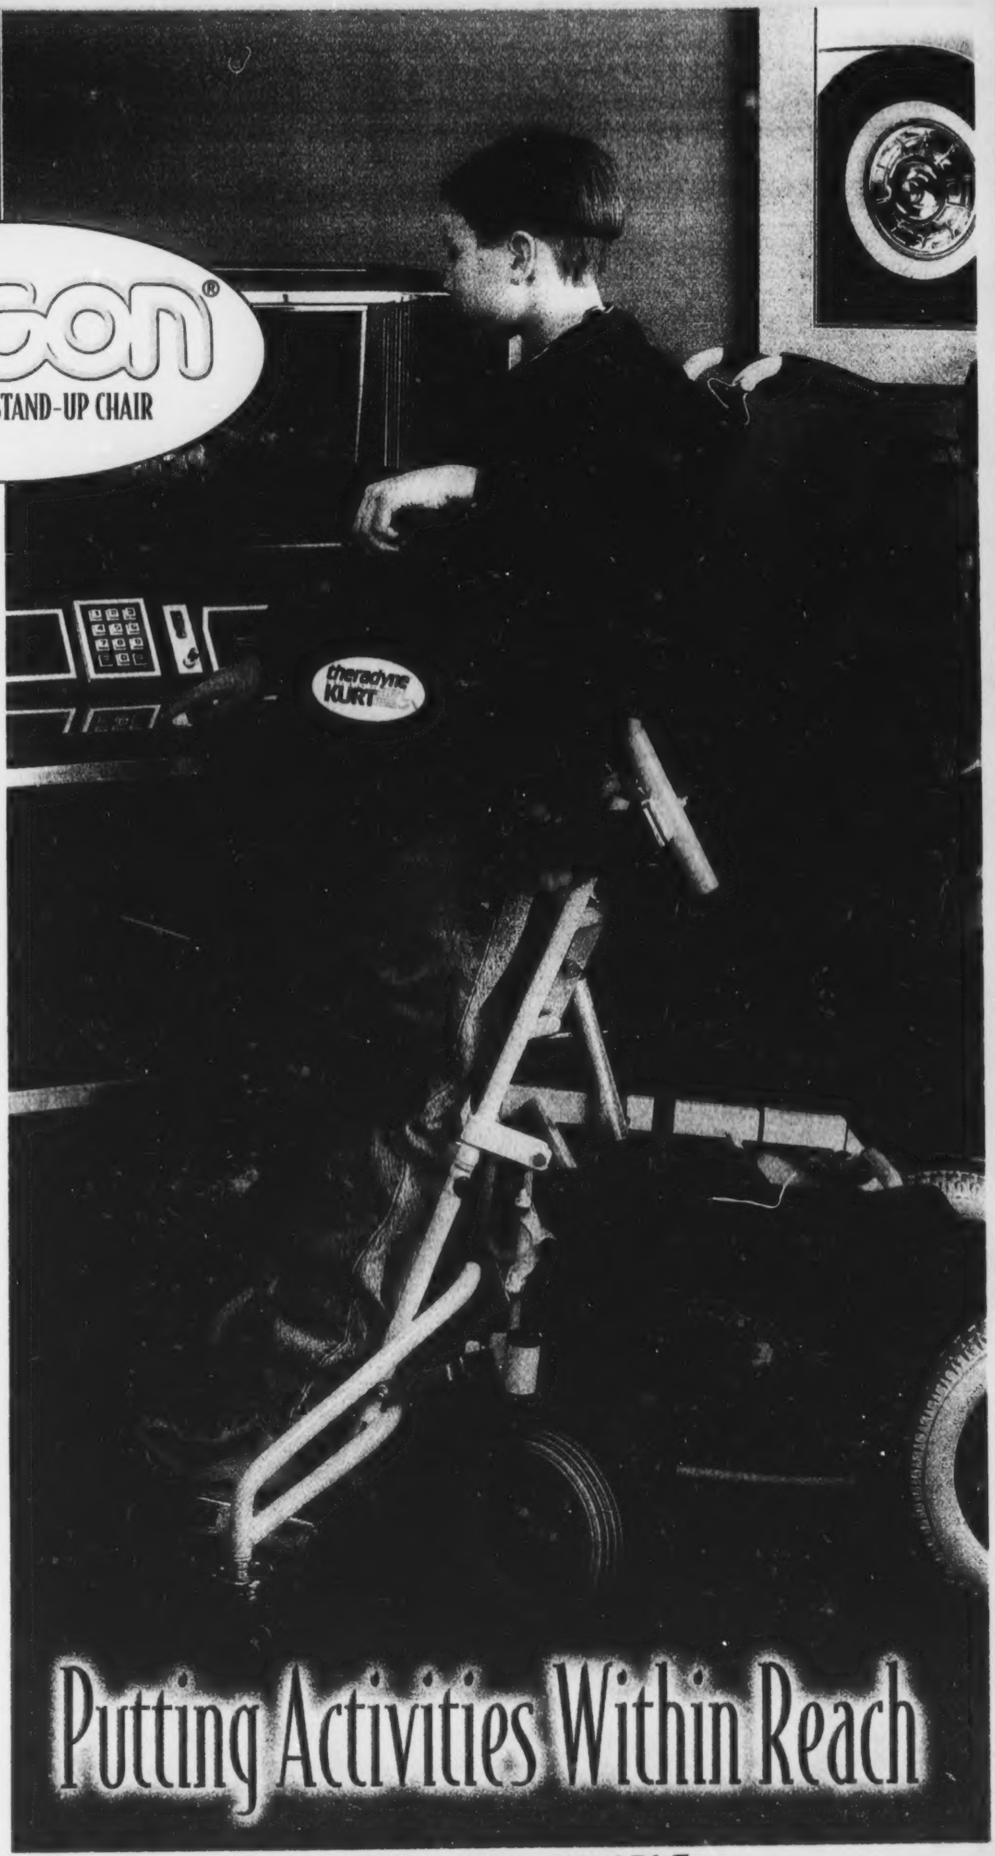
POGON®

POGON PS POWER STAND-UP CHAIR



When your child's activities call for interaction on an "eye-to-eye" level, the Pogon PS is up to the task.

The Pogon PS is a pediatric power chair with the ability to be mobile in a standing position. The Pogon PS allows your child to become more independent and roam from one activity to another. And it puts more activities within reach, while offering your child the physical benefits of standing.

Call or fax today for more information and a brochure.

MassGeneral Hospital for Children

WHAT DOES THE WORLD LOOK LIKE TO A FOUR-YEAR-OLD? *Just ask one.*

Consider for a moment what the world looks like to a four-year-old. It's something we do quite a bit at MassGeneral Hospital for Children. We look at the world from the child's perspective because we understand how important it is that you and your child feel secure while you're with us. By partnering with you, the parents, we can better understand each child – inside and out. Then together, we make care decisions that are specially suited for the child's individual needs. When it comes to caring for children, we've been recognized as one of the best in the country. So when you choose MassGeneral Hospital for Children, you'll feel confident your child will receive world-class family-centered care from people who truly remember what it's like to be a child. To find out more about our program and the full complement of primary care physicians and specialists or to receive our directory of physicians, call 1-877-KIDSMGH. The MassGeneral Hospital for Children is a hospital within Massachusetts General Hospital, a member of Partners HealthCare System.

MASSGENERAL HOSPITAL FOR CHILDREN CONFERENCE 2000

Humanizing HealthCare for Children and Families: The Art of the Relationship

Formerly ACCH annual conference

The conference explores the importance of relationships and partnerships between families, professionals, community, businesses and government within the health care setting.

Topics include:

- Spiritual Care
- Emotional Support
- Community / School Integration
- Helping Children with Sickness and Death
- Family Centered Care
- Volunteer Programs, Child Life Initiatives, Child and Family Advisory Committees
- Family Resource Rooms
- Creating Healing Environments

For further information on this exciting conference or to obtain a conference brochure please contact Mary Lou Kelleher at the MassGeneral Hospital for Children at 617-724-5720 or by e-mail: mkelleher@partners.org

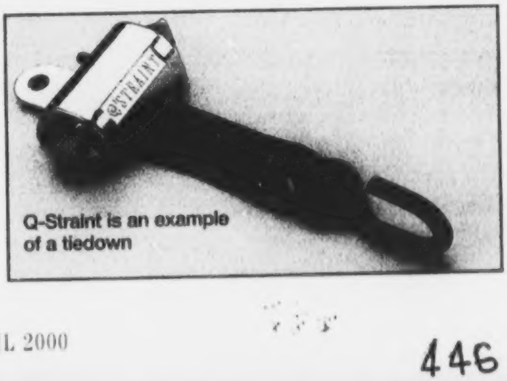
NEW DEVELOPMENTS IN SAFER TRANSPORTATION

FOR WHEELCHAIR USERS

Lawrence W. Schneider, PhD

Not too many years ago, it was common practice for students with physical disabilities to travel "sideways" in school buses and other van-type vehicles. The students were seated in their wheelchairs, which were positioned with backs up to the bus wall facing the aisle or center of the vehicle. The wheelchair was often "secured" during vehicle travel using bungy cords, belts, or pins through the wheel rims. The wheelchair occupant was usually restrained by horizontal belts placed around the abdomen or chest, but in many cases no restraint was provided. Little or no consideration was given to providing a measure of occupant protection in the event of a vehicle crash.

It is now widely recognized that facing wheelchair-seated occupants sideways in a vehicle is the least safe direction in the event of a frontal crash. It is also widely accepted that wheelchair-seated occupants should face forward in the vehicle, as do all other school bus passengers. In 1993, Federal Motor Vehicle Safety Standard 222 was amended to require installation of forward-facing wheelchair securement stations in original-equipment manufactured buses. In 1996, SAE Recommended Practice J2249, entitled "Wheelchair Tiedowns and Occupant Restraint Systems (WTORS) for Use in Motor Vehicles," was completed, and today there are many WTORS in use today that have been designed and tested to comply with this Recommended Practice.



Q-Straint is an example of a tiedown

SAE J2249 specifies numerous design and performance requirements for WTORS. The most important requirement, however, is that the wheelchair tiedown and occupant restraint system demonstrate effective performance when dynamically loaded by a 187-lb test wheelchair and a 170-lb adult crash dummy in a 30-mph, 20-g frontal impact test. SAE J2249 allows the use of any type of wheelchair tiedown that can effectively secure the test wheelchair in this test, but it requires that a belt-type occupant restraint with both upper and lower torso belts be provided (e.g., a three-point lap/shoulder belt or a four-point harness).

Wheelchair tiedowns

A docking-type wheelchair tiedown is one in which components on the wheelchair engage and lock with vehicle-mounted components. It is quick and easy to use, but these systems are generally quite expensive and are currently only suitable in situations where a single wheelchair user will be traveling in the vehicle (e.g., in a family vehicle). Docking systems also require the addition of components to the wheelchair frame to provide for engagement with the vehicle securement system.

The most effective wheelchair securement system that can be used with a wide range of wheelchairs is the four-point, strap-type tiedown system. A typical four-point strap-type tiedown consists of four adjustable-length straps that attach to the wheelchair at four securement points. The straps have floor anchors that insert into anchor tracks or other floor-mounted brackets. Examples of WTORS that have been successfully tested to SAE J2249 and that utilize a four-point tiedown with a three-point (lap and shoulder) belt occupant restraint include systems by Q'Straint, Kinedyne, Orthosafe, and Ancra.

The many commercially available four-point, strap-type tiedown systems now being used for forward-facing wheelchairs and occupants have significantly improved the safe transportation of wheelchair-seated passengers. However, until recently, an important part of effective occupant-protection systems remained a major problem in providing for safe transportation for wheelchair users. This part of the problem is that wheelchairs have not been designed for use as a seat in motor vehicles and, most important, they have not been designed to provide for easy and effective securement and occupant support in a crash situation.

Wheelchair crashworthiness

The wheelchair problem has recently been addressed by the development of a new ANSI/RESNA standard for "Wheelchairs Used as Seats in Motor Vehicles." This standard was developed by the Subcommittee on Wheelchairs and Transportation of the ANSI/RESNA Wheelchair Standards Committee.

The new standard called ANSI/RESNA WC/19 or 'WC/19" is expected to be approved and published in the spring of this year. It specifies design and performance requirements for "transit" wheelchairs, or wheelchairs that include a transit option. It also specifies information about the wheelchair that the manufacturer must include in presale literature and user documentation, as well as labels that must be permanently placed on the wheelchair indicating compliance with WC/19.

One of the most important requirements of this standard is that a WC/19, or transit wheelchair, must provide four, easily accessible attachment points to which four strap-type tiedowns can be connected for effective wheelchair securement. These securement points must comply with the specific geometry and location requirements to enable quick attachment of hook-type tiedown end fittings, or attachment of tiedown strap webbing, and must demonstrate sufficient dynamic strength to effectively secure the wheelchair in a 30-mph, 20-g frontal impact.

The primary drawbacks to the four-point tiedown system are that it is somewhat time consuming and difficult to use. However, by requiring securement-point geometry that allows for attachment by hook-type end fittings, the standard not only addresses improved crashworthiness of the wheelchair frame and seat, but it addresses improved ease of wheelchair securement using this very effective and universal system.

Occupant restraints

The new standard also addresses improvements in occupant restraint for wheelchair-seated occupants in two ways. Within the next two years, manufacturers of a WC/19 transit wheelchair must have their wheelchair pass tests using a wheelchair-anchored pelvic belt that will connect to a vehicle-anchored shoulder belt.

In addition, the standard requires that a wheelchair be rated with regard to its ability to accommodate the use of a vehicle-anchored, three-point belt system. This rating includes assessment of how easy it is to place a vehicle-anchored belt restraint on the wheelchair occupant, location and angles of the lap and shoulder belt on the user's body, and proximity of belt webbing to sharp edges on the wheelchair that could damage or cut the restraint webbing material. The results of this rating (A = excellent, B = good, C = fair, or D = poor) must be disclosed in the manufacturer's presale literature so that prospective buyers are aware of whether vehicle-anchored restraints can be easily and effectively used.

A guideline document to ANSI/RESNA WC/19 will be available in a few months and is available now for SAE J2249 on the Web site of the University of Pittsburgh Rehabilitation Engineering Center: http://www.rerc.upmc.edu/STDsDev/stdsindex.html. These guideline documents explain the rationale behind each of the requirements of these standards and clarify the purpose of each requirement. (See Resources box.)

What's ahead

It is important to note that many wheelchair and WTORS manufacturers, along with researchers and consumers, have been active participants in the development of these new standards. Also, many wheelchair manufacturers, and all of the major wheelchair companies, are now designing and testing many of their product models for compliance to the new transit wheelchair standard. As a result, motor-vehicle transportation for people in wheelchairs should be a lot safer and a lot easier in the years ahead.

There are still many issues yet to deal with concerning the safe transportation of students and adults in wheelchairs, but most of the primary issues have been addressed in these new voluntary standards. It is now up to consumers and transit providers to encourage the purchase and use of transit wheelchairs and J2249-compliant WTORS, and to ask manufacturers for evidence that their products comply with the new standards. **EP**

Left, and below: Jim Jeffreys in the basketball game held at William Paterson University on November 8, 1999. *Photo by Craig Phillips.*

Try Doing It Sitting Down

by Denise Stone, PhD

I first met Jim Jeffreys, a talented graphics artist who is working on his Masters degree in photography, in the computer lab at William Paterson University in Wayne, New Jersey. I could not miss noticing that Jim's computer chair was actually a wheelchair. Low to the ground with a single front wheel, the chair looked very unique. As an assistant professor in the special education teacher training program at WPU, I was very interested and asked him if his chair was for a special purpose. Jim, who has no legs or hips, quietly told me that he was a wheelchair athlete and had crafted this athletic style chair in his garage, using spare parts from old wheelchairs.

We continued to talk and I learned a great deal—about accessibility, responsibility, and human potential.

"Resident Geek"

Jim shared with me his concerns about accessibility on the campus. He pointed out that many campus buildings were only minimally accessible, and even the new campus changes took students way out of the ordinary path. Over the past few months, he had been working with the University's ADA officer, Janet Barone Desenza, assessing the campus' wheelchair accessibility. "Janet listens," says Jim. Though more still needs to be done, the new accessible doors and elevator that were installed as a result of their assessment, have made an impact.

Jim also mentioned to me how most students have never said anything to him about his wheelchair. Showing his wry sense of humor, Jim said he had thought at times of going around wearing a T-shirt reading "Resident Geek," to bring attention to the issues of disability and accessibility. He hit upon the idea of having the University host a wheelchair basketball game in which campus students would compete against wheelchair athletes and, as Jim said, "try doing it sitting down."

He talked about the importance of issues of diversity, acceptance of differences, highlighting potentials and accessibility. He convinced me that this basketball game would be a meaningful event for the students on our campus. Anyone who meets Jim realizes the message he has gotten from the

people in his life is not to accept a "no" or "can't." There is always a way to accomplish your goals.

In the process of planning the game, I asked Jim about his life. He related a story that has altered my life and those of the many other William Paterson University students who have come to know him.

Coming home

Thirty-two years ago, Jim was born to a South Korean mother who was pregnant by an American soldier. It was a difficult pregnancy, and she took medication, possibly thalidomide, to help her through. The son she gave birth to, whom she named Kim Byung Chul, had a congenital birth defect, phocomelia, which left him without a pelvis or legs.

Though her culture would not have disapproved if the boy's mother had let him die, she instead gave him up for adoption at Holt International Orphanage in Korea. Jim fondly recalls one of his nurses, Sung Lee, who learned how to care for his unique disability, yet let him develop his independence.

At age 4, Kim was adopted, sight unseen, by James R. and Harriet Jeffreys of Nutley, New Jersey, and his name was changed to James Elwood Jeffreys. The couple had two children, a daughter and a son, and though both Mr. Jeffreys and his son faced the challenge of having osteogenesis imperfecta, (a brittle bone disease, see "Ask the Doctor," page 94) Mr. and Mrs. Jeffreys shared a deep faith and a commitment that led them to open their hearts to other children without a family. Besides Jim, the Jeffreys family would grow to include five more children by adoption and one foster child. All five boys in the family have some type of disability. Harriet Jeffreys explains simply, "The children needed a home. They're all unique, and they're all family." Being part of this remarkable family would help shape Jim's future.

The Jeffreys family in Jim's early years. Jim is on Harriet Jeffreys' lap. James Jeffreys, Sr., is seated at right.

"Do what you can with what you have"

Jim describes his father as a "go-getter." Mr. Jeffreys, who used a wheelchair, was a cabinetmaker by trade as well as a stock car and speedboat racer. He showed his children through example that nothing should limit their dreams. "Each child had the opportunity to pursue whatever he or she wanted," explains Mrs. Jeffreys. "No child was ever offered more than the others." Mrs. Jeffreys served as a missionary in Nigeria in the 1950s and has had a career as a registered nurse. Of his mother, Jim says, "I have great respect for her. She is a person who could accomplish anything." He remembers that from early on, he was encouraged to be independent. When he started kindergarten, he had just gotten a new set of prosthetic legs and a set of "Canadian," or forearm, crutches. "The school had stairs leading to the entrance, and the principal offered to carry me," Jim recalls. "My mother said, 'No, he has to learn to walk.'" He jokes, "At that age, I would rather have been carried!"

The Jeffreys made no excuses for any of their children. Growing up, each of them had to do chores around the house and were made fully aware of their importance as individuals with something to offer the world. Their parents made a point of accentuating the positive. "You have to be happy with yourself," Mrs. Jeffreys points out, emphasizing the motto they taught their children was: "Do what you can with what you have." Encouraging their children to do as much as possible is a bit of advice Mrs. Jeffreys shares with other parents, saying "Don't tell them they can't do something when they can."

When Jim reached high school, however, he faced a difficult choice regarding his independence. The high school was larger and the halls filled with too many students to safely navigate on his prosthetic legs. He could easily be knocked down and injured. Jim decided to give up the legs for a wheelchair.

Shooting for the stars

It was then that Jim's dad put up a basketball hoop in the back yard. Though Jim was very small at the time and could not reach the net, his dad persisted. "He told me that he was not going to let me be a couch potato, and that I should get involved in wheelchair sports," Jim recalls.

He started playing and later joined the Parsippany, New Jersey, Elks Wheelers Basketball Team. Jim considers Mike Lione, his coach, to be one of the great influences in his life, challenging him to try harder. "Mike pushed me beyond my limits, beyond where I thought I could go," says Jim. Mike has remained his coach, mentor, and friend for the past 20 years and he also got Jim "hooked" on basketball.

Hoop dreams

Planning Jim's dream basketball game grew to become a concerted effort involving the University student government and associations such as the Student Council for Exceptional Children. Though they had never met Jim, the students felt the importance of his message and were motivated by his determination. The marketing manager of the New Jersey Nets basketball team was also contacted, and the team generously donated a signed basketball to raffle off. It was decided that profits from ticket sales and the raffle would be donated to the Paterson Unified Sports Program, a local group that provides children

SUMMER CAMPS & PROGRAMS FOR CHILDREN WITH SPECIAL NEEDS

Children's Specialized Hospital offers a variety of summer camps and programs for children and adolescents with physical, developmental, and learning disabilities.

COMMUNI-KIDS:
A speech and recreation program for children with mild to moderate speech delays.

RAINBOW FISH:
Beginner instructional swim program for children with physical disabilities and/or developmental disabilities, PDD (autism) or AD/HD.

TEEN EXPEDITION:
A program for teens which will allow them to experience supervised, independent travel.

OUTDOOR ADVENTURES:
A week-long sleep away camp experience for children/adolescents with physical disabilities.

CAMPOREE/UNDER THE UMBRELLA:
Arts, crafts, sports, cooperative games, music, and special activities for children who have physical disabilities, PDD (autism) or AD/HD.

CAMP CHATTERBOX:
An overnight, intensive therapy camp for non-speaking children and adolescents who use augmentative and alternative communication systems and a training program for their parents.

MOVERS AND SHAKERS:
A sensory motor group program of occupational, physical, and speech therapy activities for children with developmental delays.

CHAT AND SNACK:
An oral motor, group program of exercises to strengthen and improve movements for talking and eating.

KUNG FU/KARATE:
Martial arts instruction for children with AD/HD, cerebral palsy, or any diagnosis causing gross motor or fine motor problems.

DEVELOPMENTAL DANCE:
A dance program for children with any diagnosis causing gross motor, fine motor, or social interaction delays.

READY, SET, SCHOOL:
A program to enhance pre-writing skills for children with fine motor difficulties.

PALS PARADISE:
Creative arts, drama, martial arts, and crafts for children with physical or developmental disabilities.

THERAPEUTIC HORSEBACK RIDING:
A program for children and adolescents with physical disabilities or movement dysfunction.

Children's Specialized Hospital
An Affiliate Member of the Robert Wood Johnson Health System

continued from page 39

with and without disabilities an opportunity to participate in athletics together. The game was growing even greater in significance, and its benefit would now be felt in the local as well as the University communities. No one was prepared, however, for it to take on a much deeper meaning.

Last fall, while plans for the basketball game were underway, Jim's father passed away. The feeling of the students was all the same. They had never met James R. Jeffreys, but they had respect and awe for the man who overcame his own disability to provide a wonderful home for nine children. The children, now grown and each with a job and pursuing his or her goals, returned home to pay their respects. "They were encouraged to do whatever they wanted to do despite their limitations," Mrs. Jeffreys notes with pride, "and they all did."

Postscript

When Jim came back to school, I suggested we make the game a tribute to his dad. Jim said, "That would make my dad very proud." Jim's life has made a difference in many lives. The game was the symbol, the galvanizing event, but the message is to support each other in life as we "try doing it sitting down." **EP**

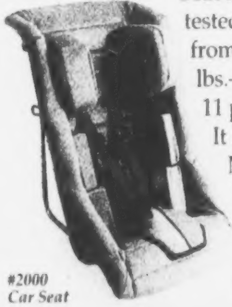
Johnny, 51 lbs. and 48" tall, in the Columbia Car Seat
Sharing the Caring

Columbia offers you solutions to the daily challenges of transporting, bathing and toileting your child – ***with comfort, safety and ease!***

You and your child face some tough challenges, but you're the one who must solve them in the most practical ways. Here's how we can help:

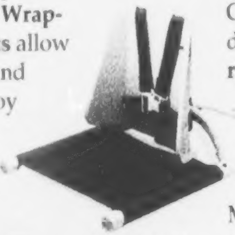
■ When your child has outgrown that infant car seat, you can have peace of mind knowing that the **Columbia Car Seat** has been crash tested for children from 20 to 102 lbs.–yet weighs only 11 pounds! It has been the No. 1 choice since 1986, for its adjustability and stylish comfort.



#2000 Car Seat

■ At bathtime, our popular **Reclining Chairs** and **Wrap-Around Bath Supports** allow your child – and you – to enjoy the bath.

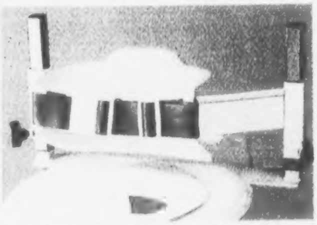
#8600 Medium Recliner for a child 40"-54" tall, up to 130 lbs.



#7700 Hi-Back Wrap-Around Support

■ At toileting time, our **Toilet Supports** fit easily onto any toilet; remove easily, too. And our **Positioning Commodes** give the same toileting support in any location.

Why do these products work so well? Columbia products are thoughtfully designed, with each item available in the **right size for your child**, with lots of adjustability for a custom fit. They are made of durable materials, tested and proven in real-life experience. Made in the USA and sold all over the world, Columbia products are leaders in *all* their categories.



#4200 Small Support for children

Mobility-Equipment Exchange and Recycling for Users of Mobility Devices:

The "Back in Action" Program

by David Chamalian

As young children grow into adolescence and, eventually, young adulthood, their needs change, as do technology and the availability of a broader range of products. Mobility devices, such as walkers, standers, wheelchairs, etc., that were once useful become either too small, no longer suitable, or passed over for a different or newer device. With the help of equipment exchange programs, a conduit exists for these neglected devices to be placed in the hands of people who need them.

Meghan Voit, Project Manager (left), and Dan O'Neill, Director of Back in Action, inventory the equipment available through the used assistive device recycling center at Matheny School and Hospital in Peapack, NJ.

Back in Action

Back in Action is New Jersey's statewide equipment exchange program. (Many states have assistive technology projects which operate a similar equipment exchange program—see editor's note.) This nonprofit program essentially serves as a "matchmaker"—bringing together potential buyers and sellers of used mobility and assistive technology devices, such as wheelchairs (both power and manual), walkers, canes, standers, scooters, adapted vehicles, stairlifts, computers, electronic communication devices, etc. The Program Coordinator of Back in Action, Kenneth Robey, PhD, explains that the program serves a very practical function. "Countless wheelchairs, crutches, adapted computers, and other devices are sitting in basements and garages because they are no longer needed by whoever purchased them. Recycling programs like Back in Action," he continues, "help to get those devices to the people who need them."

POTENTIAL BUYERS NEED ONLY CALL THE TOLL-FREE NUMBER IN THE CATALOG TO BE "MATCHED" WITH THE PERSON SELLING THE ITEM.

Equipment exchange is easy

Back in Action's catalog lists, free of charge, all products that are for sale, including a description of the product. There is also a section in the catalog dedicated to items requested. Potential buyers need only call the toll-free number in the catalog to be "matched" with the person selling the item. (Sellers retain possession of the item until sold.) Contact information will then be furnished, and the transaction will proceed privately between the buyer and seller. Back in Action serves only as the initial go-between.

Recycle your used mobility devices

Back in Action also accepts donations of mobility and assistive technology devices. All donated equipment is evaluated, cleaned, repaired or restored (if necessary). It is either advertised for sale in the catalog for only the cost of the refurbishment, made available for loan, or given to someone who needs it. Says Dr. Robey, "The recycling of used assistive devices benefits everyone involved: the person who needs assistive technology but cannot access it through other means; the person who has valuable equipment but no longer needs it; and the taxpayer whose tax dollars are not being spent on the purchase of expensive equipment." Since insurers have prohibitive rules on reimbursing for certain items, programs like Back in Action help make used and re-conditioned equipment affordable.

EDITOR'S NOTE: Back in Action in New Jersey is one of 44 state assistive technology programs in the country that operate equipment exchange/ loan services. The program is administered by the Matheny School and Hospital in New Jersey under the auspices of the Rehabilitation Engineering and Assistive Technology Society of North America (RESNA) and its Technical Assistance Project. RESNA is an interdisciplinary association of people with a common interest in technology and disability. **EP**

To contact **Back in Action** or to order a catalog, call Meghan Voit, Project Manager, at (800) 554-2626; or log onto their Web site: http://www.matheny.org/backinaction. To find out if your state has a similar equipment exchange/loan program, see the State Assistive Technology Programs directory in EP's Annual Resource Guide 2000 (pages 100-101) for listings of each state's Technical Assistance Project; or contact the RESNA Technical Assistance Project at (713) 524-6686; (703) 524-6639 (TTY); E-mail: resnata@resna.org; Web site: http://www.resna.org/hometa1.htm.

Dear Parents:

When my son was born with brain damage, my family and I had no idea how our lives would be affected. We did not see how vulnerable our child was and how he would need our care and protection for the rest of his life. We did not understand that we would become his life-line in so many ways, and he in turn would consume our lives.

As an attorney, I have become deeply involved in brain injury and other birth injury cases throughout the country.

We would be interested in looking into your child's birth if you had complications either during pregnancy, during delivery, or after delivery.

Our medical staff includes a board certified obstetrician and a registered obstetrical nurse.

Please call 1-800-888-LAWS and speak with either an attorney or a registered nurse.

Remember, there are time restrictions.

Sincerely,

Sheldon O Zisook

What are self-propelled standers?

These devices are standers that children can push by themselves. Also called "mobile prone" or "dynamic" standers, they allow children the benefits of standing with the opportunity to explore their environment, strengthen accessory breathing muscles, upper trunk musculature and upper extremities, as well as to improve head control.

In the past, children with gross motor dysfunction have been placed in stationary standers—stuck in one place with no room or chance to move around. This is called "static" standing and occurs when the child is passively supported in the upright position and does nothing to actively maintain this position by him or herself.

The latest research shows that "dynamic" standing may be better than "static" standing. Dynamic standing occurs when the individual is free to practice balancing and changing positions, as well as flex and extend the ankles, knees, and hips. It just makes sense that active is better than passive. Dynamic Systems and Motor Control/Learning Theories would all support this idea.

Luckily, practice and theory have caught up with each other and the means of providing the opportunity for dynamic standing is readily available through the use of self-propelled standers. With these devices, a child can practice dynamic standing with the freedom to move both within the constraints of the device to propel it around the room or building. Many companies are marketing these devices. We have defined this line of products as all upright standers that have the option of being propelled using both hands and/or arms. Powered systems have not been addressed.

Who are they for?

Self-propelled standers are appropriate for anyone who can tolerate being placed upright (try the Wheelabout, Rabbit or Standing Dani if they cannot) and has even the most remote potential to push the wheels. All of these standers have their large wheels placed high up in front of the individual to make pushing much easier. Children who are too weak to push their wheelchair when the wheel rims are placed below and behind their bodies, can easily move the wheels on these standers.

We have worked with kids who had little to no use of their arms and hands who began learning about movement using hand-over-hand guidance from an adult or sibling. If a child has little to no voluntary movement in his or her hands but has a "startle" reaction, this response can be used, and sometimes it can be shaped over time into a voluntary action. This can be done by placing the child's hands on the stander's wheelrims and then in some way eliciting the startle response (i.e such as by clapping or touching the child). If the child reacts by pushing his or her arms away from their bodies, the wheels will move.

From this, the child discovers that "If I move a part of my body then my entire body moves through space." What a wonderful cause and effect experience! This movement will stimulate the body's balance response, and a whole slew of sensory information will be processed. In many children with severe disabilities, this one lesson in cause and effect may be one of the richest educational experiences we can offer. Children learn that they can move and can have an impact on their body, their environment, and their world. This simple lesson may form the basis of switch toy use, powered mobility, and/or augmentative communication.

What benefits have we seen?

- Increased passive range of motion of hamstrings and hip flexors
- Clearer breathing
- Increased vocalizations
- Increased upper extremity use

Who had trouble using this equipment?

- People with severe hypotonia (floppy muscles)
- People with severe opisthotonus (extensive arching)
- People with hemiplegia (weakness on one side of the body.) If the individual can only push with one hand, it causes the device to go around in circles)

What's missing from almost all the products?

- One arm drive
- Fancy (cool colors/patterns) and two sided spoke covers (except Rabbit)
- Cogs to push
- Fully adjustable foot plates (except Standing Dani, Rabbit and Mulholland)
- Optional ventilator tray (except Standing Dani)

Other benefits

In our experience, many children and adults with even the most severe gross motor dysfunction, can learn to push these devices short distances in six to nine months. Self-propelled standers may also be used to teach head control. We have used these products for children that have little or no head control (the exceptions are if they have tracheotomies, wakeful apnea, or other breathing problems).

Self-propelled standers offer a new way to help kids with gross motor dysfunction and developmental delays to improve in their control over posture, strength, range of motion, and understanding of how their bodies interact with their surroundings. For children who have tight hamstrings, heelcords or hip flexors and need prolonged stretching, self-propelled standers offer and excellent option.

These devices also benefit children who cannot yet stand independently or have poor trunk control. This can be achieved by simply lowering the trunk support as much as is safely possible and encouraging the child to use trunk muscles by leaning, weight shifting, and pushing the wheels. Last but not least, another important benefit of self-propelled standers over traditional stationary standers, is that they can provide opportunities for interaction and FUN! **EP**

GOING MOBILE

TWO PUBLICATIONS PROVIDE INFORMATION ON ADAPTIVE TRANSPORTATION

Following is excerpted material from two sources that provide practical, step-by-step information on how to choose and successfully adapt a vehicle for transporting a person with a disability.

The US Department of Transportation has recently published a brochure entitled "Adapting Motor Vehicles for People with Disabilities." The information in this brochure is a general overview on preparing yourself and mapping out your strategy for choosing the right vehicle and having it adapted. It is based on the research and experience of driver rehabilitation specialists and other individuals who work to facilitate the adaptation of motor vehicles for people with disabilities. Rhonda Dinello, program analyst for the Consumer Automotive Safety Information Division of the National Highway Traffic Safety Administration says, "This brochure contains information that guides parents through a proven process for adapting motor vehicles—to ensure their children's safety and to optimize mobility. It is a practical guide based on government engineer studies put into plain English."

The accompanying side bar, "Tips to Remember When Choosing Adaptive Vans and Adaptive Wheelchair Carriers," details the search for the proper vehicle and its adaptation. The excerpt is adapted from a book by Becky Plank, executive director of the National Mobility Equipment Dealers Association. To order the book, write to Becky's Treasures, Inc., 909 E. Skagway Ave., Tampa, FL 33604-1747.

WHERE TO BEGIN

Evaluate your needs

Driver rehabilitation specialists perform comprehensive evaluations to identify the adaptive equipment most suited to your needs. Upon completion of an evaluation, you should receive a report containing specific recommendations on driving requirements or restrictions, and a complete list of recommended vehicle modifications.

Finding a qualified evaluator

To find a qualified evaluator in your area, contact a local rehabilitation center or call the Association for Driver Rehabilitation Specialists (ADED). (See Resources section for contact information.) The Association maintains a data base of certified driver rehabilitation specialists throughout the country. Your insurance company may pay for the evaluation. Find out if you need a physician's prescription or other documentation to receive benefits.

Evaluating passengers with disabilities

Evaluators also consult on compatibility and transportation safety issues for passengers with disabilities. They assess the type of seating needed and the person's ability to exit and enter the vehicle. They provide advice on the purchase of modified vehicles and recommend appropriate wheelchair lifts or other equipment for a vehicle you own. If you have a child who requires a special type of safety seat, evaluators make sure the seat fits your child properly. They also make sure you can properly install the seat in your vehicle.

HOW TO DETERMINE IF YOU NEED A SPECIAL VEHICLE OR IF YOU CAN MODIFY AN EXISTING ONE

Select the right vehicle

Selecting a vehicle for modification requires collaboration among you, your evaluator, and a qualified vehicle modification dealer. Although the purchase or lease of a vehicle is your responsibility, making sure the vehicle can be properly modified is the responsibility of the vehicle modification dealer. Therefore, take the time to consult with a qualified dealer and your evaluator before making your final purchase. It will save you time and money.

The following questions can help with vehicle selection. They can also help determine if you can modify a vehicle you own.

- Does the necessary adaptive equipment require a van, or will another passenger vehicle suffice?
- Can the vehicle accommodate the equipment that needs to be installed?
- Will there be enough space to accommodate your family or other passengers once the vehicle is modified?
- Is there adequate parking space at home and at work for the vehicle and for loading/unloading a wheelchair?
- Is there adequate parking space to maneuver if you use a walker?

TIPS TO REMEMBER WHEN CHOOSING ADAPTIVE VANS AND ADAPTIVE WHEELCHAIR CARRIERS

Excerpted and
adapted from:

DISABLED DOESN'T MEAN IMMOBILE

Adaptive Aids for
Transportation
Matching Vehicle
Disability,
Vehicle and Equipment

by Becky Plank

Mobility is probably the most important privilege any human being has in today's world. Today, finally, we have the necessary technology to assist in converting vehicles for the physically challenged so they may exercise that privilege.

Nonetheless, adaptive-equipment dealers and driver-evaluators are rightly concerned that consumers are not aware of the products available to them. Consumers needs to know where to turn, and what steps to follow, when purchasing their vehicles and equipment.

If you have any questions about your vehicle and/or equipment, find an adaptive-equipment dealer and/or a driver evaluator/trainer. They can answer your questions, or will assist in finding a solution to your problem.

PURCHASING AND ADAPTING VANS

FULL-SIZE VANS

When choosing a van to transport a person with a disability, there are many details to keep in mind.

- One of the most important things to consider is the **engine cover**. (Editor's note: In full-size vans, the engine usually extends into the vehicle.)

1) How far does it extend into the vehicle?
2) Does the engine cover become an obstacle to easy transfer or swiveling?

Occasionally, people have suffered injury to their feet, ankles, and legs (in some cases even breaking a bone) because their feet got caught between the engine cover and the seat.

- Another part of the van to consider is the **height of head space**. Measure from the floor to the roof, and then determine your seated height, obtained by measuring from the floor to the top of the head when you are seated in a wheelchair.

If you plan to drive, or even just ride, from your wheelchair, you need enough room for movement.

- The necessary head space can come from a couple of options.
- One is **raising the roof**, i.e., cutting out the factory roof and adding a higher fiberglass top. There are several roof brands and models available, along with the cosmetics needed for an attractive van after the conversion.
- Your evaluator may prescribe a **lowered floor** for your van. That requires cutting out the floor's metal, lowering the floor itself, then welding back the metal.

Remember to have the new flooring undercoated if your dealer does not include it in his service. And, if you require a lowered floor, be certain your dealer has a certified welder on staff.

The number one consideration in purchasing a van when the floor must be lowered is the frame. It is highly recommended that the van have a frame and not a unitized body (where the body is the frame). Some dealers do build a frame for lowering the floor in a unitized body, but the expense is very high. Some dealers will not perform this procedure. This is another example of the need to consult with your dealer before purchasing a van.

- If you are purchasing a full-size van to use with a wheelchair lift, you need a long **wheelbase**, or extended body. This will give you ample room to maneuver your wheelchair when entering and exiting the van.
- Do not forget to measure the doors as well. If, for any reason, you cannot bend your head forward, you should ask your dealer about **raised doors**. These are doors in which a lift is installed.

Raised doors have an extra panel of metal welded to the top of each door. The top needed for raised doors is different. Thus, if you have your van converted but do not include the raised doors, all of the interior may need to be removed to install the proper top for raised doors—an unnecessary expense.

MINI-VANS

When choosing between purchasing or converting a mini-van, there are two alternatives:

- Have the dealer convert the vehicle locally. There are currently a number of products (i.e., lifts, raised tops, etc.) that will work when converting the mini-van.
- Order your vehicle from a manufacturer of mini-vans for the physically challenged.

If you decide to go this route, there are currently several models of mini-vans on the market for people with disabilities. These mini-vans have been attained from one of the automobile manufacturers, then literally taken apart for modification. Thus, you need to be certain the mini-van modifier is recognized by the automobile manufacturer so as to avoid factory warranty problems.

Getting in and out

The following are the two most important considerations when a wheelchair user is entering and exiting a mini-van:

- Head room inside the vehicle: See if you need a raised roof with the lowered floor; and
- Height of the doors: To enter and leave the van.

Most of the mini-vans on the market have a lowering device—an air bag below about the size of an old-fashioned oatmeal box—with an air compressor. They are also equipped with ramps, whether in the side or rear. These vans are small, as the name implies, which provides the convenience of a small vehicle, but limits the number of passengers you can transport. And, if you choose the rear entry ramp, keep in mind you will lose the rear sofa and center seats. You need to discuss this with your dealer and/or evaluator.

A **dual battery system** is available from the adaptive-equipment dealer. The purpose of a dual battery is to provide power, should there be a power failure in the main system. The reserve power will let you exit the van safely.

continued on page 50

continued from page 49

Have wheelchair, will travel

Taking a wheelchair along in a van or car can be accomplished by using a carrier to lift it. Carriers store manual wheelchairs for the journey while the wheelchair user rides in the vehicle. Wheelchair carriers come in four basic styles:

1) The automatic car-top carrier.

The car-top carrier is an electric motor-driven hoist. A steel pin lowers, picks up a manual wheelchair, and the chair folds as it rises to the carrier. The carrier then closes. All the functions are operated by switches.

If your needs include a car-top carrier, it will be of utmost importance that an adaptive equipment dealer examine the car before the purchase.

Among the things he or she will be checking are:

a) The actual size of the roof—will the roof be able to accommodate the carrier?

b) The make of the carrier in which you are interested, (i.e., is it too heavy for the car model you have chosen?).

2) The bumper-mounted carrier.

A bumper-mounted wheelchair carrier for a manual wheelchair could get complicated if combined with a molded auto bumper. Occasionally the bumper-mounted installation requires the adaptive-equipment dealer to drill a couple of holes into the bumper. These can be plugged should you remove the carrier later. One more thing to consider is the accessibility of the trunk. Most of the bumper-mounted carriers can easily be removed to give access to the trunk.

3) The hitch-mounted carrier.

These carriers tilt down to load the wheelchair and easily tilt up and lock in place.

4) The pick-up carrier.

This carrier is for use on pickup trucks. The wheelchair will have to be folded, then the lift picks up the chair with an electric-driven motor and stores it in the bed of the truck.

TYPES OF WHEELCHAIR LIFTS AVAILABLE

Platform lifts

The platform lift stores either in the side, the rear, or under the floor of the van. The lift requires two doors, or the sliding door on the side of a van. The platforms have expanded metal in the upper half of the platform for better visibility when the lift is folded and the van is being driven. The fold-in-half platform folds to give better accessibility to the doors.

continued from page 50

The under-the-floor lift requires modifications under the van to the exhaust system, gas tank, etc., depending upon the make of van. There are both solid and fold-in-half platforms. Some of the fold-in-half platform lifts are mounted on a single post.

Be aware of the difference between automatic and semi-automatic lifts. A fully automatic lift will fold, unfold, lower and raise by operating a switch, usually located on the dash, but in some cases, on the side of the lift. A semi-automatic lift requires manual folding and unfolding of the platform. A hand-held pendant switch mechanically lowers and raises the platform.

Rotary Lifts

Another lift is the rotary, sometimes called a "swing" lift. The platform never folds, it swings inside, outside, and up-and-down. The rotary lift swings into the van and the lift platform sits on the floor in the middle of the van.

Some individuals like the rotary lift because of the parking convenience. Less room is needed to enter or exit the van. Also, this lift is mounted on one post inside the van. The post controls the swinging action of the lift. One of the drawbacks to the rotary lift, though, is the cross-over bar. On some rotary lifts, this bar connects the platform to the swing bar, and limits space for loading and unloading on the platform.

Backup Systems

Switches operate the lifts as well as the power openers. In the event of a power failure, however, a backup system is necessary.

Many government agencies require a lift to have a backup system for use in emergencies. The lift then can be manually maneuvered and users can exit the van with assistance from an outsider. Most of the backup systems are too hard to operate alone, so expect to need someone's help.

Safety flaps

All lifts have an extension or "curb" at the edge of the platform which is approximately three to four inches high. This safety flap is designed specifically to prevent the wheelchair or scooter from rolling past the edge of the platform.

There are advantages and disadvantages associated with all lifts. No one lift fits the needs of every individual. It all depends on the individual's needs and wants. However, after reading this section you can be aware of what to look for when purchasing a lift that will accommodate your needs.

---

continued from page 48

- What additional options are necessary for the safe operation of the vehicle?

Choose a qualified dealer to modify your vehicle

Begin with a phone inquiry to find out about credentials, experience, and references. Ask questions about how they operate, such as:

- Do they work with evaluators?
- Do they require a prescription from a physician or other driver evaluation specialist?
- How long will it take before they can start work on your vehicle?
- Do they provide training on how to use the adaptive equipment?

If you are satisfied with the answers you receive, check references; then arrange to visit the dealer's facility. Additional questions you may want to ask are:

- Are they members of the National Mobility Equipment Dealers Association (NMEDA) or another organization that has vehicle conversion standards?
- What type of training has the staff received?
- What type of warranty do they provide on their work?
- Do they provide ongoing service and maintenance?
- Do they stock replacement parts?
- How much will the modification cost?
- Will they accept third party payment?
- How long will it take to modify the vehicle?
- Can the equipment be transferred to a new vehicle in the future?
- Will they need to modify existing safety features to install the adaptive equipment?

Vans can be purchased already adapted, or may be modified by an accredited dealer.

Training on the use of new equipment

Both new and experienced drivers need training on how to safely use new adaptive equipment. Your equipment dealer and evaluator should provide information and off-road instruction.

Cost saving opportunities

The costs associated with modifying a vehicle vary greatly. Therefore, whether you are modifying a vehicle you own or purchasing a new vehicle with adaptive equipment, it pays to investigate public and private opportunities for financial assistance. There are programs that help pay part or all of the cost of vehicle modification, depending on the cause and nature of the disability. For information, contact your state's Department of Vocational Rehabilitation or another agency that provides vocational services, and, if appropriate, the Department of Veterans Affairs (see the Resources section). Also, consider the following:

- Many nonprofit associations that advocate for individuals with disabilities have grant programs that help pay for adaptive devices.

ADAPTIVE RECREATION

Easy Riders

Adaptive biking makes it easier for people with disabilities to get out and on the road.

by Ryan Mayo

As the snow melts, cyclists everywhere are getting geared up for the upcoming warm weather. The outdoors are calling, and it is time to get behind the handle bars for another great summer of exercise and fun.

Biking for people with disabilities has seen a popularity surge in the past few years, and the technology to accompany it is astounding. In fact, adaptive cycling has an amazing array of possibilities for all kinds of disabilities, proving that it can be an incredible recreation opportunity for all.

"I think it helps a lot of people physically," says Stacey Parker, an instructor with the National Sports Center for the Disabled (NSCD) in Winter Park, Colorado. "Biking really works the major muscle groups, helping motor control and balance. It gets the blood flowing and helps people feel good about themselves emotionally as well."

Setting the wheels in motion

There are two main classes of bikes ideal for use by people with disabilities: tandem and hand-cranked (hand cycles). The tandem bikes are designed to have a "pilot," or driver, in the front seat, while a cyclist with a disability pedals in the back seat. This is ideal for children with a physical disability, visual impairment, head injury, or cognitive delay. Hand cycles are good for use by children with lower-body disabilities, including those involving spina bifida, multiple sclerosis, muscular dystrophy and cerebral palsy. It is important to find the right fit between the rider and bike.

A child with a below-the-knee amputation on a mountain bike enjoys the freedom of adaptive cycling.

Tandem biking requires a pilot to be seated in the front. Above, a teen who is blind takes a break with her pilot.

PHOTO BY KIEFEL SPORTFOLIO AND THE NATIONAL SPORTS CENTER FOR THE DISABLED

Both types of bikes are easily adaptable for different needs. On tandem bikes, "bear claw" pedal cages with straps can be attached to keep the rider's feet from sliding off the pedals. Hand cycle riders can put their hands in "cuff mittens," which are attached to the pedals to aid in gripping. Varying the shape of the pedals or handle bars for easier and better grip is also an option. Lap or chest belts can help tandem bike riders stay positioned in the saddle. If keeping balanced in the saddle is too difficult for the rider, however, a hand cycle is usually recommended. Velcro straps can be used to keep the legs in place on the hand cycle.

A bicycle built for two

Balance, trunk control and leg muscles come into play when riding on a tandem bicycle. Children work along with their pilot in front to achieve the bike's motion. It is a team commitment, and the two riders must work to communicate at all times to be successful.

"We use tandem bikes mostly for people who are blind and for those who don't feel comfortable using their arms," said NSCD instructor Tony Peters. "Balance control is important in tandem biking, but the student only has to focus on pedaling rather than steering. For beginners, we will have instructors who will walk or jog alongside the bike until the duo get the hang of riding together."

One of the great things about tandem bikes is that they are very versatile. The NSCD uses tandem mountain bikes with large, fat tires.

continued on page 56

continued from page 55

The bikes work well in all kinds of terrain, but the instructors will assess the skill and comfort level of the rider before jumping into anything new. "We look at the goals of the student to decide the type of terrain to ride on," Peters said. "We typically use flat, paved routes early on, moving on to more advanced mountain bike trails if necessary. We build on their progress so they'll want to come back and bike some more."

In some cases, tandem biking can lead to riding a two-wheeler independently. Debbie Zambo believes that cycling has been a great addition to the active life of her 16-year-old son, Keith, who has a developmental disability and is learning how to ride an adult BMX bike.

"I always felt it was important for Keith to go on family outings and participate in the activities," she reports. "He feels very proud of himself when he gets going on his bicycle, even if it is on the tandem bike. Physically, his balance is getting much better, and he is more outgoing and confident. The challenge has been for him to realize that he can do it on his own. I think it's been a really positive experience for him."

Hand cycling helps to promote independence in children with lower-body disabilities.

"Hand"ling the road

While tandem bikes require using the legs, hand cycles are pedaled with the arms. The bikes have three wheels and 21 gears to make navigating hills easier. As a rule, hand cycles are used on paved or gravel trails, not on mountainous terrain.

Beginners on a hand cycle will usually start out with an instructor keeping up beside them on in-line skates. This allows the instructor to assist the rider in action, helping him with problems that may arise as they get used to the bike. The participant, using her arm, shoulder, and back strength, can achieve real physical improvements, not to mention greater confidence on the bike. "For those with paraplegia, it's tough to get cardiovascular work in," said Peters. "But hand cycles really get them going. It's fun exercise, and the fact that it's outside just makes it better for them."

Most notably, hand cycling is great for promoting independence in kids with lower-body disabilities. "All kids love to ride bikes," said Matt Feeney, an avid biker who has paraplegia (level T-9). "People with a limitation or physical challenge might have felt left out before. Hand-cycling allows freedom from their wheelchairs, and they're not left out from participating with their friends on bikes. It's very liberating."

Tandem biking is a great way for individuals with visual impairments to enjoy the sport of biking.

Whether it is getting outside on the back of a tandem, or feeling the freedom of a hand cycle, bicycling is one of the best activities in promoting independence from a person's limitations. The ever-evolving technology is making it easier than ever for people with disabilities to participate with their able-bodied peers and friends. Feeney loves the feeling of being able to surpass his buddies on their bicycles. "The technology is really leveling the playing field for us," he said. "Now adaptive cycling programs can parallel

Hand cyclists use their arm, shoulder, and back muscles to propel the vehicle.

How to get started

First and foremost, all bikers should wear a helmet. When choosing a helmet, make sure the fit is snug and that the helmet covers the head, coming all the way down almost to the eyebrows.

Your local bike shop may have tandem bikes or hand-cycles for rent. Look for adaptive cycling equipment at your local Parks and Recreation Department, especially if they offer a special needs program. You can call your local children's hospital or rehabilitation center, or check your area for an adaptive sports program like the National Sports Center for the Disabled or a chapter of Disabled Sports USA.(See Resources for contact info).

able-bodied programs. It's very exciting." **EP**

Pull-Ups's GoodNites®
DISPOSABLE ABSORBENT UNDERPANTS

GoodNites® Brand Touches Lives In An Unexpected Way

Kimberly-Clark Corporation, makers of GoodNites® disposable absorbent underpants, is proud to be a corporate supporter of the World Congress and Exposition on Disabilities. Our participation is part of our ongoing support of families and caregivers of children with special needs, and our commitment to helping every child become a little more independent.

We understand that independence means different things to different people. For children with special needs, it could mean getting dressed by themselves, bathing themselves, or simply getting through the day dry. We also know that helping someone with special needs become more self-sufficient can be a major challenge, but can also be extremely rewarding.

When GoodNites® disposable absorbent underpants were introduced in 1994, they were intended for the seven million children in the U.S. who wet the bed at night. However, it quickly became evident that GoodNites® underpants also serve a very important role among individuals with special needs who experience delayed toilet training or bladder and/or bowel control difficulties.

"We didn't realize how many people could benefit from using GoodNites® underpants both day and night as part of their regular routine," explains Gary Melliere, Product Manager for GoodNites® disposable absorbent underpants. "We've received hundreds of calls and e-mails from parents and caregivers of individuals with special needs thanking us for a latex-free product that's big enough to fit children up to 125 pounds, protects against leaks, and gives children a little more independence. Many of these children have outgrown training pants but still want a convenient product similar to regular underwear—one that isn't an adult diaper."

As we have worked to understand the needs and challenges faced by these children and their families, we have observed how parents and those who care for individuals with special needs have impacted research, therapies, funding, philosophies, and behavior. They have changed bus schedules, doorway dimensions, attitudes, policies, and the law. Most of all, they have moved people to action by their commitment to making a difference in the lives of the people they care for.

We have the highest respect for that dedication and commitment, and we share in the effort to make a positive difference in the lives of every family and child we serve. That's why we are proud to support the World Congress and Exposition on Disabilities. We hope that GoodNites® underpants will, in some way, help make life a little easier for individuals with special

n, technology and a whole lot of fun!

A World-Class 3-Day Event

Join forces and voices for people with disabilities

For Everyone: Meet representatives of advocacy groups, government agencies, and organizations. Get hands-on introductions to the latest innovations in technology, health care, recreation and fun, including technology and software workshops, a sports and recreation activity center, toys, games and videos. Visit the Career Fair planned for people with disabilities, allied healthcare professionals and educators.

40 education-packed conference sessions produced by the EP Foundation for Education, Inc.

EP Foundation
for Education, Inc.

For Families, Direct Support Professionals and People with Disabilities: Experienced parents and professionals share strategies and techniques for planning and problem-solving in the home, the family, the community and the world at large. Seminar and workshop topics will include: financial assessment and estate planning, health insurance issues, development of a lifetime medical plan, the medical home, caregiver burnout, and others.

For Physicians, Physical Therapists, Occupational Therapists, and Other Health Care Professionals: Symposia, lectures and workshops presented by international experts. CME credits through the Emory University School of Medicine; CEU credits through Emory and other approved accreditation providers. Topics to be covered include: newborn screening, neurology, epilepsy and seizure disorders, autism and PDD, ADD/ADHD, mental retardation and developmental disorders, mitochondrial disorders, inborn errors of metabolism, nutrition issues, and many more.

For Educators: For all those involved in the educational development of people with disabilities or special health care needs. CEU credits through the Council for Exceptional Children. Seminar subjects include: access, inclusion and mainstreaming, IDEA and Individual Education Plans (IEPs), assistive technology, learning disabilities, and more.

www.wcdexpo.com Ramps Up to the Superhighway

For detailed, up-to-date information on the first World Congress & Exposition on Disabilities (WCD), taking place November 10-12, 2000 at the Georgia International Convention Center in Atlanta, visit www.wcdexpo.com. The site provides information about this exciting, precedent-setting conference and trade show.

Visitors to this user-friendly site will easily be able to search and gather much needed information. An important aspect of WCD is it's educational forum. By clicking on **Conference** you will be able to access the 40 symposia and seminar topics to be presented by opinion leaders in their respective areas of expertise as well as the Advisory Board which created the program. The link to **Travel Info** allows you to find out about WCD's travel management firm, Expo Travel, Inc. and get information on special rates at nearby hotels and discounts on air travel.

The **Attendee Info** page links to a current list of WCD **exhibiting companies** which is expected to reach over 200 by the show's opening. This same page will soon be able to access a state-of-the-art, secure, **on-line registration** form. Registration for a show has never been so easy.

Exhibitors will learn how WCD markets to a **targeted audience** and allows exhibitors to **capture critical attendee information**. The **Floor Plan & Rates** page displays close-ups of the show floor. By exploring the WCD exhibit floor, visitors will view locations of the many value-added features planned for the show. These hands-on, educational and fun areas, such as the **Sports & Recreation and Assistive Technology Activity Centers** will soon be detailed on the site as well as an abundance of **sponsorship opportunities**.

Also coming in the near future will be information on the WCD **Career Fair**. This section of the show is planned to encompass three distinct areas: for people with disabilities, major national corporations and local businesses will look to meet directly with qualified job applicants; for health-care professionals, exhibitors will include hospitals, clinics, rehabilitation centers, etc.; and school districts and private schools will be on hand for special education professionals.

By visiting **www.wcdexpo.com** today, you will find out more about what makes this international conference and trade show so unique.

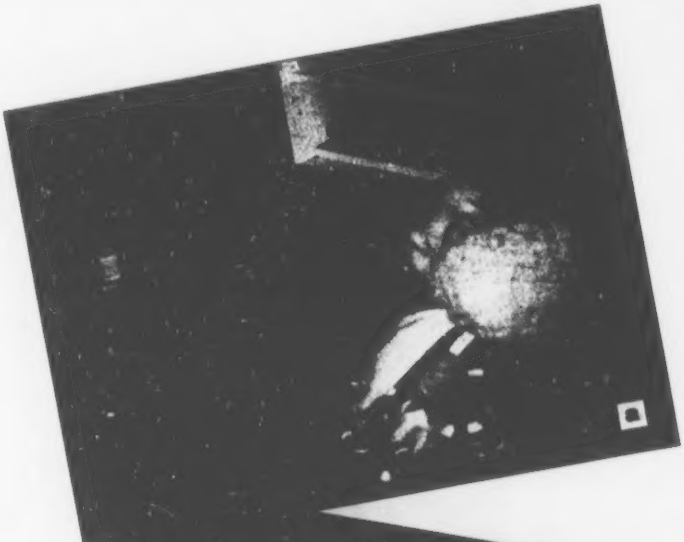
Switchin' in the Kitchen

by Jo Ann Hughes and Debby Entwistle



More than any other room in the house, the kitchen has got to be the most stimulating to the senses. Think of all the sights, sounds, smells, and tastes! Food preparation also provides endless opportunities for tactile experiences and for motor and cognitive skill development. Take a few pieces of adaptive equipment, several kitchen gadgets, and a little ingenuity and you have the ingredients for success for all.

Photos

a. Deja' uses a pour switch to transfer chopped green peppers into the vegetable soup pot.

b. Mitchell and a volunteer prepare to blend homemade salad dressing.

c. Oh, the joys of whipped cream! Whitney uses a mixer attached to a control box which is activated by a single switch.

Recipes to Try Switchin' in Your Kitchen

Fruit Salad
Ingredients:
Fruit
1. Use switch-activated a) electric peeler b) electric knife to peel and slice fruit.
2. Use switch-activated blender to puree.

High Protein Edible Play Dough
Ingredients:
1 cup of peanut butter
1 cup corn syrup
1 1/4 cup powdered sugar
1 1/4 cup powdered milk
Mix together to a good consistency for molding.

Augmentative and Adaptive ideas:
1. Mix dough in food processor or mixer with control box and switch.
2. Use pour switch to add dry ingredients.

Extra suggestions:
1. Use candy molds and cookie cutters to shape dough.
2. Press chocolate chips, raisins, M & Ms, etc, into your creations for added color, textures, detail, and taste.

Fruit Smoothie
Fruit smoothies can be made many different ways. Some are all fruit, others have yogurt or milk in them. All are mixed in a blender and can be "frozen" by adding crushed ice.

Pineapple-Strawberry-Mango
1 cup strawberries
2 cups pineapple juice
1 cup diced mango

Orange Banana
3 cups orange juice
2 cups canned apricots
2 bananas

Yogurt Smoothie
1 cup yogurt (lemon or vanilla)
1 cup orange juice
1 cup pineapple juice
2 cups peaches

You can use fresh, frozen, or canned fruit. Be creative!

Augmentative and Adaptive Ideas:
1. Use electric peeler, knife, and blender with control box and switch.
2. Use ice crusher with control box with switch (to add another step and more noise). Ice cubes work just as well.
3. Garnish with fresh fruits cut in chunks and place on skewers with cherries.

d. Matthew helps a volunteer cut peaches for peach jam with an electric knife (using a grip switch).

Kitchen Gadgets

- Electric peelers, knives, blenders, mixers, food processors, and salad shooters are must haves for the adapted kitchen. Scout out your local discount store's kitchen department and experiment. In many instances, your child will not handle the device directly, so safety concerns may not be the same.
- We found a battery-operated sifter in The Pampered Chef® catalog. It is a great addition to our pantry.

Some of our most successful projects

- The best times are had in the kitchen if the recipe has many steps and several different appliances or gadgets can be used. If you are pressed for time, however, even the opportunity for your child to do one quick step of a simple task is lots of fun. How about grinding coffee in the morning?
- Projects that offer the opportunity to explore tastes and textures of different foods have been entertaining for everyone. Fruit smoothies are a great way to experiment with new and unusual fruits. This project offers immediate gratification! (See "Recipes" box.)

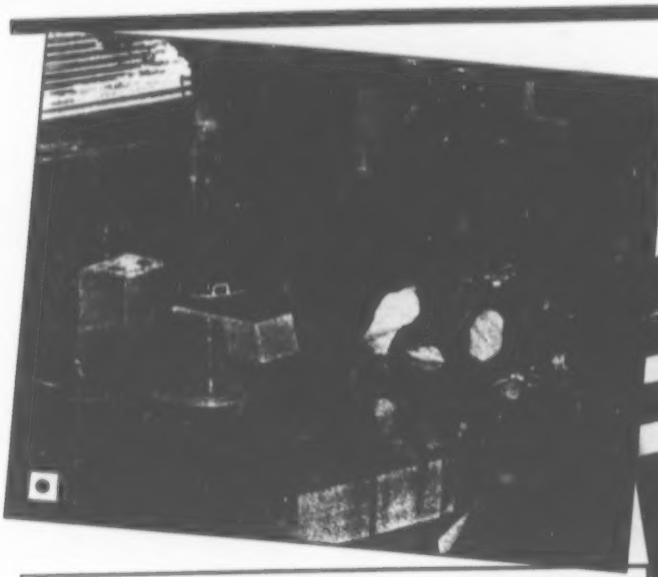
ADAPTIVE DEVICES

- A variety of switches are available to enable access to electric and battery-operated appliances. AbleNet®, Inc. and Enabling Devices®-Toys for Special Children are two sources we use frequently.
- The Power Link control unit from AbleNet, Inc. converts electric appliances to allow switch activation.
- Voice out-put augmentative communication devices provide lots of kitchen chatter and some devices also work as a switch. We use Ablenet, Inc.'s "Big Mac", "One Step", and "Step by Step" devices, as well as "Cheap Talk" available through Enabling Devices.

continued on page 66

continued from page 65

- Battery interrupters, available through both companies, make adapting battery powered gadgets a snap. (See "Resources" Box.)



Photos

e. Summer means peaches, and peaches mean jam. Tan chops them up as fast as he can!

f. Larry (r.) and Sue prepare garden grown herbs for herbed vinegars.

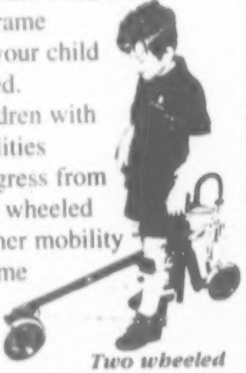
Four wheeled

Our revolutionary hands-free progressive system promotes good posture, lower limb control and natural gait. The strong, light frame gives unmatched mobility. As your child progresses, assistance is reduced. We've helped hundreds of children with cerebral palsy and other disabilities worldwide. Your child can progress from a four wheeled frame, to a two wheeled frame where they develop further mobility skills. The brace and either frame grows with your child.



Hart Independent Mobility Corporation

Circle #43

g. Nathan (l.) and Kristen (seated) are helping JoAnn (r.) and two volunteers follow the directions for making delicious pickles.

Additional Ideas

- Besides the adaptor devices that can be purchased, we have found a wonderful resource in our local gas and electric company for having battery-operated devices adapted. Electricians have volunteered their time to do this for us and although you can learn to do it yourself, you need a soldering iron and some knowledge of circuitry.
- Remember to add music to your recipe for fun. We almost always have someone in charge of operating the tape player with his or her switch during kitchen activities.
- Homemade food items make great gifts and salable items for fundraisers. Our bazaar would be sorry indeed if it were not for the jams, jellies, pickles, and baked goods we have for sale each year.

HAPPY SWITCHIN'! **EP**

Debby Entwistle is a special education teacher and Jo Ann Hughes is an occupational therapist at the Pediatric Convalescent Center, The Home of the Innocents, Louisville, KY.

Developmental Disabilities Councils

In our 2000 Resource Guide, we printed a listing of Developmental Disabilities Councils. We made every attempt to make this listing accurate, but encountered difficulties in the verification process, which resulted in some of the listings being incorrect. Listed below are the Developmental Disabilities Councils for each state, which have been confirmed. Special thanks to Lucy Walker, Public Information Specialist at the Texas Council for Developmental Disabilities for her help in this.

NADDC—NATIONAL ASSOCIATION OF DEVELOPMENTAL DISABILITIES COUNCILS
1234 Massachusetts Ave., NW, Ste. 103
Washington, DC 20005

Annandale Village: *Their Community... With Our Help!*

Our Mission:

...to perpetuate a private, nonprofit Village community offering adults with developmental disabilities an improved quality of life. The Village provides professionally managed and cost effective lifestyle alternatives through specialized programs and services flexible enough to meet individual needs. These programs are a significant part of our original goal of offering a balance of freedom, encouragement and instruction that help each Villager achieve his or her own level of independence and fulfillment.

Our Programs:

- Paid Vocational Training and Job Placement
- Creative and Performing Arts
- Recreational and Leisure Activities with Skills Training for Special Olympics
- Daily Living / Life Skills

Photo courtesy of Eagle's Cry Productions

Annandale
VILLAGE

Our Services:

FULL RESIDENTIAL

- Cottages, semi-independent and independent apartments
- Nutritionally balanced meals
- House Parenting • Case Management
- On-campus Health Services
- Medical Monitoring • Counseling
- Off-campus Transportation

NON-RESIDENTIAL DAY PROGRAMMING

Services and training, including case management, are provided based on program participation.

CAMPUS ENVIRONMENT

Secure Environment • 136 Wooded Acres
Softball Field • Villager Social Center
Farm and Orchard • Nature Trails
Outdoor Swimming Pool
15 Acre Stocked Lake • Non-sectarian Chapel

Certified by IRS as a private, 501(c)(3) NONPROFIT CORPORATION.
Georgia Permit #067-03-001-01 • Charitable Registration #01-911713

3500 Annandale Lane • Suwanee, Georgia 30024 • (770) 945-8381 • www.annandale.org

Assistive Technology 101

Assistive technology professional, R.J. Cooper, explains the jargon and shares some practical advice on putting together the right computer system to handle adaptive equipment and special software programs.

Choosing a computer system to meet a user's special needs

by R.J. Cooper

Assistive technology (AT) and how it can help their child who has special needs is often a mystery to many parents. Adding to the lack of general knowledge about AT is the fact that AT items are not readily available—they cannot be purchased at regular computer stores. In addition, literature, products, and knowledge about AT exist only within the AT community of researchers, developers, retailers, and teachers. It is time for us bring AT to a larger audience, and in effect, "blow its cover."

What Is AT?

AT is any device or adaptation that helps a person function in his or her daily life. The IDEA '97, (Individuals with Disabilities Education Act) defines AT as "any item, piece of equipment, or product system ... that is used to increase, maintain, or improve functional capabilities of a child with a disability."

For the purposes of this article, we will be looking at AT as it relates to computers and what a parent needs to get started. Let's begin by taking a look at your basic computer.

Computer systems

"What kind of computer should I get?" is a question people often ask me. Several years ago, brand, size, and specifications (or "specs") mattered. In fact, experts advised exploring the programs, or software, that you wanted to run on your computer, and then purchasing the computer that would support the software. Today, those issues are no longer critical. All name brand computers are, in my experience, very good. Personally, I lean toward Macintosh®, because they are easy to set up, expand, maintain, and use. PC compatibles (PCs) are almost always more complex in all areas.

PCs use an operating system (OS) called Windows®. An OS is the software that allows you to interact with your computer. Currently, the versions of Windows OS include 95, 98, or (soon to be) 2000, and Windows 3.1. Though it is more technical than this, simply put, Windows 3.1 is built upon DOS, which is also an operating system. On a Mac, it is called the Mac OS (up to nine versions as of now).

The world has "chosen" Windows—meaning that most software programs are designed for a Windows system. Most AT software is available for both Mac and Windows. However, there are a significant number of titles that are for either Mac *or* Windows. If you have a specific program in mind, check with its producer to make sure you are purchasing the right type of computer.

If operating Windows will be a necessity in the near future for your child, then perhaps it is best to start now. But if you do go the Windows route, try to line up a support person, such as a friend, teacher, or even a sales person from your local computer store, who is computer savvy and willing to share his or her knowledge with you.

When you buy your computer, do not worry about specifications such as RAM (or memory), hard drive space, speed, etc. Today, these specs are all great: you can no longer buy an underpowered computer. All of today's computers have plenty of hard drive space—where you store things that will stay on your computer after you turn your computer off. Two gigabytes or "gigs" is standard; (the G3 by Macintosh that I just purchased has 9 gigs). They all have sufficient memory with 16 MB (megabytes) being a minimum, and 32 MB becoming the standard (my G3 has 128 MB).

I recommend you stick with name brands (Apple, IBM, Compaq, HP, Packard Bell, etc.). Warranty should be a consideration, as should toll-free tech support. Apple, IBM, Gateway, and Dell always score high in these areas. I strongly suggest you not purchase a 'home-grown' computer put together by a friend or a small computer store. Computers such as these usually use

continued on page 72

continued from page 71

lesser quality or less compatible parts from many manufacturers, often with no support after the sale. Prices on great computers are so low these days, that there is no excuse for not getting a computer with a name brand.

Recommendations

I have three recommendations for whichever computer system you choose:

1) Get a 17" monitor. The difference between a 13" and 15" monitor is small; however, the difference between a 15" and a 17" is quite significant. A 17" monitor has a "viewable" area of 15-16". I consider 17" a minimum for children with special needs. The cost of a regular 17" monitor is about $300. Try ViewSonic, which are sold everywhere.

LCD (liquid crystal display) monitors have a viewable area equal to their size: in other words LCDs that are 15" have a viewable area of 15" and run about $1,000. LCDs are also known as "flat panel displays" because they are thin. Only 1" thick, lightweight, and with bright, clear picture quality, LCDs are wonderful. Also, they can be mounted, using special LCD arms, in positions that regular monitors cannot. Unfortunately, 17" LCD monitors are expensive (about $3,000). Once again, with either a regular or LCD monitor, go name brand.

Besides size, dot pitch is another specification for monitors. Dot pitch is a measure of a monitor's clarity; the smaller the dot pitch, the clearer your picture will be. It is more technical than that, but the effect is overall clarity. A standard dot pitch is .28, but you can go all the way up to .40 if the only things that will be on the monitor are large objects. It is only when you are using small, fine-lined items, like small font text, that dot pitch becomes significant.

Be aware that any computer monitor, whether it is for a Mac or a PC, will work with a Mac, whereas a Mac monitor will not work with a PC. Sometimes, Mac-specific monitors are priced a bit higher than the more mass-marketed monitors for PCs. With the addition of a special Mac video adapter, like that from MacAdapt, any monitor will work with almost any Mac. The LCD monitor will require the adapter listed above, or may come with one.

2) Get good, big speakers. Most systems come with small speakers. I have found that, for my work with children with special needs, especially those functioning at the cognitive level of a 0- to 2-year-old, I need sound to be clear and bold. Many companies make great speakers these days. I prefer the Altec and PC SoundWorks lines (both sold just about everywhere). Some are two- piece systems and others are three pieces with a large sub-woofer (by large I mean 6"x6"x9", which is large for a computer speaker). The three-piece systems sound superior, and have better bass response.

3) Get a floppy drive. Although all computers have CD-ROM drives these days, and floppy drives are certainly on the way out, they are still valuable. There are external ones available for both G3s and iMacs for under $100 Or you can get the Imation SuperDisk USB for about $150, which will be able to read or store information on regular 1.44 MB floppies and the Imation 120MB disks, which run about $10 each. You can get a floppy drive at any Mac or PC retail store or online mail-order stores like Macwarehouse, Maczone, PCzone or PC Warehouse. As for the CD-ROM drives, do not be concerned with their speed. They are all at least 12 times faster than what was available five years ago.

Customizing for special needs

You now have the computer and it is time to adapt or customize it for special needs. First, you can analyze your child's needs: break down the need to "access" or "instructional," with some overlap for each. By "access" I mean that some computer adaptation may be necessary for your child with special needs to use it, but your child may not have need of special instructional software. Your

Free Attends® Briefs Sample

- Perma-Dry System pulls in wetness quickly then distributes it throughout the brief and locks it away from the surface, keeping your child's skin dry and comfortable!

- A wetness indicator lets you know when the brief is wet and needs to be changed.
- Four refastenable tape tabs can be adjusted to give your child the perfect fit.
- Available in four sizes: Youth* (35-75 lbs), Small (20-31" hip), Medium (32-44" hip), and Large (45-58" hip).

*Youth size is not Perma-Dry

Circle #41

• •

child might be able to use off-the-shelf, conventional software once he or she is able to operate the computer.

"Instructional" means that you still might have some access issues, but you will also need specialized software that is designed to teach a child at his or her cognitive level.

Instructional software usually teaches, drills, or tests something, such as number concepts, or picture matching. You can buy instructional software at computer stores, but this software is usually geared toward people who function at a cognitive level of 2 years and above.

"Special" instructional software usually displays its content more slowly than regular software, the graphics are more defined, everything might be spoken as well as in print, and the choices are usually fewer, so the user does not "get lost." Regular software rarely has these special needs options. Next month, we will look at specific access adaptations for computers, and where to find them. **EP**

FINALLY,
A Nutrition
Supplement For
Special Needs...

NuTriVene-D

Targeted Nutrition Intervention

Ask your physician about NuTriVene-D
Or call for more information or to order
1-800-899-3413

As Seen On
ABC News Nightline,
The 700 Club, and
48 Hours

Children and adults with Down syndrome and other genetic disorders have unique nutritional needs. Now there's a nutrition supplement formulated for those special needs.

NuTriVene nutritional supplements include vitamins, minerals, amino acids, antioxidants, and other essential nutrients. NuTriVene may also be customized for the nutritional needs of your child.

NuTriVene does not require a prescription, although we encourage you to talk to your physician about NuTriVene.

NuTriVene may be mixed with infant formulas, foods, and many drinks. And, it contains no artificial colorings or flavorings.

"As skeptical parents we were completely amazed at the changes that occurred in our son after he started NuTriVene. He is more alert, curious, and much healthier." L. Sotok - Holland, MI

Part 3

Can We Talk?

PARENTS' PERSPECTIVES ON AAC:

Selecting the right system, now and as your child grows

by Peggi McNairn, PhD, CCC/SLP, ATP, and Cindy Shioleno, MEd

For some families, the birth of a child with a disability can be overwhelming, throwing them into an unknown world of technical and medical jargon. This was the case for Frank and Laura Warburg of Louisville, Kentucky. Nine years ago, their daughter, Candice, was born with cerebral palsy, leaving her unable to walk or talk like other children her age.

"We needed someone to help us to see the possibilities," says Laura Warburg. "When it came to communication, she (Candice) could not verbalize sounds consistently or isolate her pointer finger to indicate a choice. We knew what made her cry, though. And we knew what made her laugh out loud. We could see which direction she was looking when it came to some early choice making. That was enough for us in those early days."

AAC AS AN ONGOING PROCESS

As important as selecting the most appropriate communication system is for the child, it is even more important to realize that this selection is not just a one-time event, but an ongoing life-long process. As the communication needs of the child change, so will the need for different technology. Dr. Hal and Christi Urschel of Dallas, Texas have found this to be particularly true for their son, Chance, 4, who was diagnosed with holoprocencephaly (a neurodevelopmental disorder with multiple causes, including genetic defects). Chance faces significant motor challenges each day. "We have had to train Chance's caregivers several times in different light and high tech options," says Dr. Urschel. "As his language skills continue to improve, they have had to learn new strategies and new technology because what was once an appropriate option became suboptimal."

"We all grow out of stuff," reflects Brenda Klauditz, of Toms River, New Jersey, the mother of 17-year-old Daniel, who was born with cerebral palsy. "There is not a piece of technology that will last forever. It is always a good idea to have some insight into what is out there for our children." As Laura Warburg has discovered with Candice, "What did not work yesterday, many times will work tomorrow."

ADVOCATING FOR OUR CHILDREN

Although AAC devices may be unfamiliar to families, it is important that parents learn as much as possible so that they will be able to advocate for whatever is best for their children. "As a parent," says Brenda Klauditz, "I seem to have to advocate for anything that my son needs. We have had to battle daily with the school and have been in and out of court for the past six years."

According to Brenda, "My recommendations to parents are to know your children, believe in them, challenge them, have goals for them, expose them and stimulate them. Get involved, because ultimately it will be your job."

In 1977, to help parents advocate for the needs of their children, the United States Congress provided funding to each state to establish non-profit advocacy organizations. These organizations are charged with protecting and advocating for the legal rights of people with disabilities. For assistance, parents can contact the National Association of Public Advocacy Services at (202) 408-9514.

BECOMING AN INFORMED CONSUMER

Once the AAC assessment process has been completed and the needs of the child have been determined, the search for the device that will most closely match the needs of the child begins. During the evaluation process, the child and family should have the opportunity to become familiar with several devices to find the "best fit." During these trial periods, several important questions should be answered. (See Questions, page 76.)

IS THERE A RENTAL PROGRAM?

After previewing the equipment, the child needs a period of time to experiment with and explore the device. Parents should ask AAC vendors what type of rental program their company offers. It is also important to ask if the money used for the rental device can be applied to the purchase of the device. Many companies offer a brief loaner program at no cost to the consumer. It is important for the child to have the opportunity to use the device outside the evaluation or therapy center. How the device

[redacted]

Parents of children who use augmentative and alternative communication (AAC) devices share helpful information, stories, and insights about their experiences with the process of selecting and using communication systems.

functions at home, school, and the community is important.

DOES YOUR DEVICE HAVE A WARRANTY?

Because most high tech AAC devices may cost $5,000 or more, an important question families should ask is, "What type of warranty or service contract does your company provide?" Not only do consumers need to know if a warranty is provided, they also need to know what this warranty covers and for what period of time. Some manufacturers provide 6-12 month warranties that cover damages incurred from "normal wear and tear." Some may provide a warranty on software, but not hardware. It is important that all terms, conditions, and restrictions be clearly defined and explained in writing.

The family needs to have a contingency plan in place in the event that repairs take several months. "Is there a loaner device available to our child during the repair period?" is a question that should be answered before the service is required.

"Does your company provide an extended warranty period?" is another question that families should ask. High tech devices are designed to last several years. However, repairs to older devices can be extremely costly. Extended warranties or service contracts can save a family thousands of dollars.

WHAT KIND OF CONSUMER SUPPORT DOES YOUR COMPANY PROVIDE?

An important service that many AAC manufacturers are now providing to families and consumers is information and support in the area of funding. Working with a company that has a knowledgeable funding specialist can often help families discover funding sources unique to their state or town. Asking for information on funding sources and regulations may be the first step in obtaining an AAC device.

Many families and professionals will also require specialized, hands-on training in the use of high tech AAC devices. It is important to know what type of training the manufacturer is willing to provide and what this training will cost. Recalls Brenda Klauditz, "I am lucky that I do well with manuals, as I have never had any of the help I often hear others talk of. I find that people do not have experience in what Daniel is doing and needing. I have learned to specialize in my son's needs."

In addition to training, many AAC manufacturers offer some type of

continued on page 76

Augmentative and Alternative Communication

According to the American Speech-Language-Hearing Association in Rockville, Maryland, AAC "refers to all communication that supplements or augments speech." AAC covers a broad range of techniques, strategies, and devices, from simple picture boards to sophisticated, computer-based communication devices with synthetic voices. Other examples may include facial expressions, gestures, body postures, sign language, drawing, and writing.

Light Tech AAC Devices
Simple AAC devices that do not use electronic or computer parts, such as the use of pictures attached to a board or inexpensive devices that can record a voice, are often referred to as "light" or "low" tech devices. These simple devices are typically used to facilitate the development of emerging language and communication skills, such as choice making. However, even light tech AAC options can sometimes prove overwhelming, time-consuming, and cumbersome.

High Tech AAC Devices
Often, because light-tech systems are so simple, they may also prove to be very limiting. When this occurs, high tech AAC systems should be introduced. Today, there are many high tech communication devices on the market. Some devices are manufactured specifically for communication and are referred to as "dedicated" communication devices. Other devices, called "integrated" communication devices, are built upon a standard computer platform. Special communication software is typically added to enhance the computer's ability to function as a communication device.

Light Tech vs. High Tech
The use of light tech devices does not exclude the additional use of high tech AAC devices. In fact, AAC is most effective when thought of as a "system" rather than a specific device or piece of equipment. The greater the variety of communication options that a child has to choose from, the better opportunity he/she will have in communicating his/her thoughts in every situation.

Using this system approach avoids the pitfalls of relying on only one device or technique. High tech systems may break down and need repairs, with light tech systems serving in the interim. Also, some situations, such as bathtime, may not lend themselves to the use of a high tech system.

continued from page 75

technical assistance over the telephone or the internet. "I used technical support over the phone quite a bit in the beginning. They were really great," says Brenda.

Nothing is more frustrating than buying a new computer only to discover that it is outdated the next week. The same concern exists for AAC devices. When considering the purchase of any AAC device, the family should inquire what options are available for upgrading their child's device. Some companies offer free lifetime upgrades of their software while others charge a substantial fee.

WHAT DOES THE INITIAL PRICE QUOTE INCLUDE?

To avoid misunderstandings or unpleasant surprises, it is important for the consumer to obtain an itemized price quote for the AAC equipment. Many companies will often list only the price of the hardware, omitting the additional cost of the communication software, warranties and/or training.

IS THERE A FAMILY IN THE AREA WHO USES YOUR EQUIPMENT THAT I CAN TALK TO?

Meeting and talking with a family who has been through the selection process is an invaluable experience for most families. As Laura Warburg recalls, "We would have gained so much in those early days (and today) from one-on-one mentoring by a family with a child with similar abilities."

continued on page 78

Questions to Ask AAC Manufacturers

Is there a rental program?
- **Can the rental be applied towards the purchase?**
- **Do you have a free loaner program before the purchase?**

Does your device have a warranty?
- **What type of warranty does your company provide?**
- **Do you provide a loaner device during the repair period?**
- **Does your company provide an extended warranty?**

What kind of consumer support does your company provide?
- **Do you have a funding specialist on staff?**
- **Do you provide training?**
- **How much does the training cost?**
- **Do you provide technical assistance?**
- **What type of technical assistance do you provide?**
- **What options do you provide for upgrading the device?**

What does the initial price quote include?
- **Does this price quote include everything my child will need for communication?**

Is there a family in the area who uses your equipment that I can contact?

Is your company committed to innovation?

A dynamic breakthrough in digitized speech.

Battery
Memory
Thank You
Cool!
Hi!
Goodbye!
No way!
Excuse me

The new Dynamo Digitized Speech Device is simplicity itself. It breaks through the barriers of cost and complexity to give a whole new generation of users a chance to be heard. With its small, rugged case and a weight of just under 1.8 pounds, the new Dynamo Digitized Speech Device redefines digitized speech. The dynamic display eliminates the need for paper overlays. Scanning can be done with a single switch. Extra-long recording time allows more speech in any language. And communicators can enjoy greater independence through its infrared control.

The new Dynamo Digitized Speech Device is also a simple and economical diagnostic tool for cognitive abilities of children and seniors. Since it uses a similar menu system to DynaVox, the new Dynamo makes it easy to progress to other DynaVox communication solutions. And Dynamo is backed by DynaVox Systems, the world's leading provider of advanced augmentative communication solutions.

For more information on the new Dynamo Digitized Speech Device, call DynaVox Systems at **888-697-7332**.

About the parents:

Ed and Brenda Klauditz live in Toms River, NJ, with their 11-year-old son, Andrew, and 17-year-old son, Daniel.

Dr. Hal and Christi Urschel live in Dallas, Texas, with their 4-year-old son, Chance.

Frank and Laura Warburg live in Louisville, KY, with their 9-year-old daughter, Candice, and 6-year-old son, Joey.

continued from page 76

IS YOUR COMPANY COMMITTED TO INNOVATION?

Finding a company that provides innovations that meet different and changing needs through a variety of solutions is an important consideration in the partnership between consumer and manufacturer.

"During our initial search for the most appropriate AAC device for Chance, we discovered that many companies felt that they did not need to improve the hardware component of their devices," says Dr. Urschel. "Instead they focused most of their time on software improvements. Consequently, their devices continue to be big, bulky, and much slower than the fastest laptop computer."

For families, the selection and implementation of the most appropriate AAC device for their children is no small feat. In spite of this complicated decision-making process, the Urschel, Warburg, and Klauditz families all agree that the rewards of being able to communicate with their children are well worth the effort.

Peggi McNairn, PhD, CCC/SLP, ATP, is in private practice and serves as Texas Woman's University's Distance Learning Coordinator at the Education Service Center in Ft. Worth, Texas. She can be contacted at Quick Tech I.D.E.A.S.S., 215 Spanish Moss, Arlington, TX 76018-1540; telephone: (817)450-9561; E-mail: pmcnairn@aol.com.

Cindy Shioleno, MEd, is the Assistive Technology Specialist at the Education Service Center in Ft. Worth, TX. She can be contacted at Education Service Center Region XI, 3001 North Freeway, Ft. Worth, TX 76106; telephone (817)740-3619; E-mail: cshioleno@esc11.net.

The authors welcome questions and comments.

MEDICAL RESEARCH UPDATE

Compiled by David Chamalian

TYPE II DIABETES AND CHILDREN: DETECTION AND PREVENTION

Type II diabetes, once thought to be rare in children, is being diagnosed more often in children and adolescents. Health experts attribute this rise to growing obesity rates in kids and teens. As a result, an eight-member panel of experts, convened by the American Diabetes Association, recommends testing overweight children—those at more than 120 percent of their ideal weight for height. The panel also added recommendations to include education for children on how to manage their disease: monitoring blood glucose levels; tips on daily exercise; and dietary recommendations. Further suggestions from the panel members include regular screening for complications of diabetes, such as eye problems, high blood pressure, and kidney malfunctions. The recommendations were published in the March 2000 issue of Pediatrics.

JUVENILE ARTHRITIS AND RESISTANCE EXERCISE: A BENEFICIAL MATCH

Nadine Fisher, EdD, revealed in her research that children who have juvenile arthritis who participated in an individualized resistance-exercise program showed as much as a 200 percent improvement in their ability to function. In addition, the results showed a marked drop in their pain, disability, and use of medications. "We expected to see a change in the disease with exercise," Fisher said, "but we didn't expect to see so much. Everybody showed tremendous physiological improvement—better strength, endurance, and even better aerobic capacity...Everyone had less pain." An accompanying investigation, done by Jaya Venkatraman, Phd, reveals the reason for such positive results: the exercise induced a change in immune response. Nadine Fisher, EdD, is assistant professor of occupational therapy and rehabilitation medicine, and Jaya Venkatraman, PhD, is associate professor of nutrition. Both are affiliated with the University at Buffalo. Results were presented at a joint meeting of the American College of Rheumatology and the Association of Rheumatology Health Professionals.

NEW SURGERY AVAILABLE TO AID BREATHING FOR PEOPLE WITH QUADRIPLEGIA

Abbot J. Krieger, MD, has discovered a surgical procedure to regenerate the phrenic nerve (which stimulates the diaphragm to move the lungs) and allow people to breathe on their own. The procedure, which has been performed successfully on six people, involves grafting living intercostal (between the ribs) nerves into the dead or damaged phrenic nerve. After approximately six months, nerve regeneration occurs, and the new nerves assume control over the electrical functions of the phrenic nerve. A pacemaker is also inserted to help the fused nerve send the correct "breathe" signal to the brain. "Breathing through a ventilator wears on the body and makes quadriplegics more susceptible to fever, infections, and pneumonia—the primary cause of death in quadriplegics," says Dr. Krieger. "This procedure eliminates the brute force of the ventilator and reproduces the smoothness of the natural breathing process, thereby prolonging the life span of many quadriplegics." The procedure was presented at the Congress of Neurological Surgeons 49th Annual Meeting.

PSYCHIATRIC DRUG PRESCRIPTIONS ON A SHARP RISE AMONG YOUNG CHILDREN

In the period between 1991 and 1995, researchers have found a dramatic increase in the number of preschool children taking stimulants, antidepressants, and other psychiatric drugs. Some of the drugs cited in the study were methylphenidate, the generic form of Ritalin®; clonidine, a blood pressure drug that treats insomnia associated with attention disorders; and Prozac® and Zoloft®, both antidepressants. The assumption among researchers is that the increase has continued since 1995.

What is troubling about the results of this study, researchers say, is that data on the safety and efficacy of these medications in preschoolers just do not exist. "We don't have any benchmarks to know if this is or is not a problem," says Dr. Julie Magno Zito, associate professor at the University of Maryland and lead author of the study. Dr. Zito and her colleagues report that few of the drugs are approved by the Food and Drug Administration for use in treatment of children under 5.

Experts are also troubled by the lack of research on how these drugs affect brain development. Says Dr. Joseph Coyle, chairman of psychiatry at Harvard Medical School, "These [drug] interventions are occurring at a critical time in brain development, and we don't know what the consequences are."

Clarification: In last month's column, we published an update on neurotransmitter disorders. In it we stated, "The result [of lack of information about and rarity of neurotransmitter disorders] is that many children may remain misdiagnosed and improperly treated." We would like to clarify this statement as follows: "The result is that many children may remain undiagnosed and potentially untreated."

Correction: Under the same heading, we printed the incorrect Web site for the Pediatric Neurotransmitters Disease Association. The correct Web site is http://www.pndassoc.org. We regret the errors.

EP

Your child's disability may have been preventable

Your child may have been harmed by something that happened during pregnancy, labor, or delivery, or by exposure to a toxic substance. Parents often have no way to know what might have caused their child's disability.

Let us review whatever information you have about your child's disability. If it turns out that the disability was preventable, your child may be entitled to receive compensation to pay for the best care available, as well as for all the other losses.

Call us today toll free from anywhere in the United States at 1-800-THE-EAGLE for a free consultation to discuss whether legal representation might help you and your child.

Goldberg & Osborne is an Arizona law firm that will associate with lawyers experienced in birth injury cases throughout the United States, in order to provide you with quality legal representation in your state.

POINT

On January 25, 2000, the National Council on Disability (NCD) issued its independent analysis of federal enforcement of civil rights laws. The report, entitled, "Back to School on Civil Rights: Advancing the Federal Commitment to Leave no Child Behind" looks at more than two decades of monitoring and enforcement of compliance with the Individuals with Disabilities Education Act (IDEA).

According to its mission statement,

> "The NCD is an independent federal agency making recommendations to the President and Congress on issues affecting 54 million Americans with disabilities. NCD is composed of 15 members appointed by the President and confirmed by the US Senate.
>
> The NCD's overall purpose is to promote policies, programs, practices, and procedures that guarantee equal opportunity for all individuals with disabilities, regardless of the nature or severity of the disability; and to empower individuals with disabilities to achieve economic self-sufficiency, independent living, and inclusion and integration into all aspects of society."

In its report, the NCD reveals some startling information. The NCD has found that "federal efforts to enforce the law over several Administrations have been inconsistent, ineffective, and lacking any real teeth." We have excerpted some of the major findings from the report's Executive Summary. (Following this excerpt is the response by Judith Heumann, assistant secretary, Office of Special Education & Rehabilitative Services, US Department of Education.)

BACK TO SCHOOL ON CIVIL RIGHTS: ADVANCING THE FEDERAL COMMITMENT TO LEAVE NO CHILD BEHIND

In the more than two decades since its enactment, IDEA implementation has produced important improvements in the quality and effectiveness of the public education received by millions of American children with disabilities. Today almost six million children and young people with disabilities ages 3 through 21 qualify for educational interventions under Part B of IDEA.

As significant as the gains over time are, they tell only part of the story. In the past 25 years, states have not met their general supervisory obligations to ensure compliance with the core civil rights requirements of IDEA at the local level. Children with disabilities and their families are required far too often to file complaints to ensure that the law is followed. The Federal Government has frequently failed to take effective action to enforce the civil rights protections of IDEA when federal officials have determined that states have failed to ensure compliance with the law.

FINDINGS:

- Every state was out of compliance with IDEA requirements to some degree.
- Notwithstanding federal monitoring reports documenting widespread noncompliance, enforcement of the law is the burden of parents who too often must invoke formal complaint procedures and due process hearings. Many parents with limited resources are unable to challenge violations successfully when they occur.
- The Department of Education has made very limited use of its authority to impose enforcement sanctions such as withholding of funds or making referrals to the Department of Justice, despite persistent failures to ensure compliance in many states.
- More than half of the states failed to ensure compliance in five of the seven main compliance areas.
- 90 percent had failed to ensure compliance in the category of general supervision.
- 88 percent failed to ensure compliance with the provision that requires schools to promote the appropriate transition of students with disabilities to work or post-secondary education.
- 80 percent of states failed to ensure compliance with the laws free appropriate public education requirements.
- 78 percent failed to ensure compliance with the procedural safeguards provision *[defined as parental rights to examine records, to obtain independent educational evaluations, to receive prior notice if a service is refused, to consent prior to any evaluations of services, to be granted an impartial due process hearing, to be allowed an administrative appeal and civil action in state or federal court, and to be afforded confidentiality.]*
- 72 percent failed to ensure compliance with the placement in the least restrictive environment provision.
- Only one enforcement action involving a sanction (withholding) *[of federal funds]* and five others involving imposition of "high risk" status and corrective action as a prerequisite for receiving further funds have been taken. The only withholding action occurred once for a temporary period and was overruled by a federal court.

RECOMMENDATIONS:

- Congress should amend IDEA to create a complaint-handling process at the federal level.
- Congress should amend IDEA to provide the Department of Justice with independent authority to investigate and litigate cases brought under IDEA.
- Congress should include in the amendment that the Department of Education and the Department of Justice shall consult with students with disabilities, their parents, and other stakeholders to develop objective criteria for defining 'substantial noncompliance.'
- The Department of Education should establish and use national compliance standards and objective measures for assessing state progress toward better performance outcomes for children with disabilities and for achieving full compliance with Part B.
- The Department of Education should consult with students with disabilities, their parents, and other stakeholders in developing

and implementing a range of enforcement sanctions that will be triggered by specific indicators and measures indicating a state's failure to ensure compliance with Part B.

- Regular and special education teachers in many states are frustrated by the mixed messages regarding compliance from school administrators, local special education directors, state oversight agents, school district attorneys, and federal oversight agents. Teachers ultimately bear the responsibility to implement interventions and accommodations for students with disabilities, often without adequate training, planning time, or assistance. They must function within an educational system that often lacks adequate commitment, expertise, or funding to deliver appropriate services to every child who needs them.
- Pervasive and consistent noncompliance with IDEA is a complex problem with often dramatic implications on a daily basis for the lives of children with disabilities and their families. Too many parents continue to expend endless resources in confronting obstacles to their child's most basic right to an appropriate education, often at the expense of their personal lives, their financial livelihoods, and their careers. Students are frustrated—their skills undeveloped and their sense of belonging tenuous.
- Congress and the President should appropriate [funds for] free or low-cost legal advocacy services to students with disabilities and their parents through public and private legal service providers.
- The Department of Education should give priority support to the formation of a comprehensive and coordinated advocacy and technical assistance system in each state.
- Lawyers should be available at every state Parent Training and Information Center, and a backup system should be established with legal materials, training, and support for attorneys who are working on IDEA cases. Training in culturally sensitive dispute resolution and the accommodation of multiple language needs and communication styles should be implemented.

To date, federal compliance-monitoring and enforcement efforts have not fully dealt with the root causes of widespread noncompliance, and children with disabilities and their parents have suffered the consequences. NCD calls on Congress and the President to work together to address the inadequacies identified by this report so that children and families will have an effective and responsive partner in the Federal Government when they seek to ensure that IDEA's goals of enhanced school system accountability and improved performance outcomes for students with disabilities move from the language of the law to the reality of each American classroom.

Excerpted from "Back to School on Civil Rights: Advancing the Federal Commitment to Leaving no Child Behind" Report by the National Council on Disability, January 25, 2000. The full report can be obtained from the NCD Web site, http://www.ncd.gov.

COUNTERPOINT

THE DEPARTMENT OF EDUCATION RESPONDS

Judith E. Heumann, assistant secretary, Office of Special Education & Rehabilitative Services, US Department of Education, has been kind enough to make available the statement issued by the Department of Education in response to the NCD Report.

"The National Council on Disability report draws our attention to how this important federal law has been monitored and enforced. We concur with one of the major premises of this report: parents should not bear the burden of enforcement just to get their children an education. Families should be partners with schools, states and the Department of Education in the effective implementation of the law.

Since IDEA was implemented, more than six million infants, toddlers, and children with disabilities are provided early intervention and special education services. The [NCD] report draws critical attention to the fact that not all children with disabilities in America receive an appropriate education. It is also important to recognize that there are a growing number of states, schools, and districts that are aggressive in ensuring both compliance and the provision of quality services for children.

The report accurately indicates that there are compliance problems throughout the country. These problems vary by state in severity, complexity, pervasiveness, and longevity.

In 1998, the Department of Education reinvented its system for monitoring state compliance with IDEA after extensive input from advocacy organizations and members of the disability community, including some of our strongest critics.

We have already seen increased involvement of parents,

LEGISLATIVE UPDATE

by Julie Keys

This month, we introduce a new feature highlighting current activities in Washington which impact the special needs community. This installment has been provided by Family Voices' National Communications/Development Coordinator, Julie Keys. Family Voices is a national, grassroots clearinghouse for information and education concerning the healthcare of children with special health needs. As their mission describes, "Family Voices follows public and private sector healthcare changes affecting our children with special healthcare needs."

"YOUR VOICE COUNTS"

The past few months have seen increased activity around important issues for our children and families, including healthcare and education and some bills before Congress that can make a big difference in our children's lives.

Family Voices and Brandeis University recently released a report: "Your Voice Counts!" the Family Partners Project Survey. The survey is the first of its kind, designed, distributed, and analyzed by families and researchers. We surveyed over 2,200 families in 20 states who have children with special healthcare needs. We found that families across the country report tremendous challenges in accessing healthcare information for their children. While some families are faring well, many experience difficulty in finding skilled providers and getting necessary information. For example:

- ☆ Only 60 percent of the families gave their plan's benefits a good or excellent rating in meeting their child's health needs.
- ☆ Many mothers provide more than 20 hours/week of healthcare services at home to their child.
- ☆ Nearly two-thirds of the families had reduced their hours of employment and/or stopped working altogether because of their child's health.
- ☆ Approximately 37 percent of the families had contacted their health plan regarding a problem, and 42 percent of those families were not satisfied with the resolution.
- ☆ Families who have children with behavioral health diagnoses or complicated health conditions report the most problems in obtaining adequate health care for their children.

The survey reflects a picture of families experiencing multiple demands and stresses. The results of the survey, reinforced by stories we have heard for years from families around the country, should help policymakers realize how crucial it is that all families receive more help than they are now receiving, especially families with children with special healthcare needs.

To that end, Family Voices made some policy recommendations to Congress:

- ☆ Pass legislation to make Medicaid available to all children who need specialized services and allow them access to the comprehensive benefits packages provided by Medicaid. This will help guarantee an adequate health coverage package and reduce out-of-pocket expenses paid by families who currently rely on less adequate private coverage. This access can be through a sliding fee scale, or other buy-in program.
- ☆ Legislate mandates and funding to support Family-to-Family Health Information Centers in each state. These Centers will provide families across the country direct access to trained, experienced families who can help them find the information they seek—how programs work, how to get access to them, where to find support and how to resolve other problems in caring for their children with special healthcare needs.
- ☆ Make funding available to measure the quality of care that our children with special healthcare needs receive.
- ☆ Pass a Managed Care Patient's Bill of Rights that will protect our children with special health care needs.

While we had hoped that Congress was listening, little did we know how quickly we would be heard! About a month after the briefing, Senator Charles Grassley (IA) and Senator Edward Kennedy (MA) introduced the Family Opportunity Bill of 2000. This bill has three parts:

1. Make a Medicaid buy-in available to families with children under 21 if their children meet the disability determination established by SSI (supplemental security income) but the child is ineligible due to the parents income.

The Joy of Independence

Spring Time by Amy Neubauer

The joy of self-expression shines every day for students at Crotched Mountain Rehabilitation Center. Just 50 miles from Boston, surrounded by New England villages and towns, freedom and independence are celebrated with every graduating class. Throughout our progressive 60-year tradition, students have been realizing their dreams and achieving success.

Here, families and their special children find the highest standard of care, education, and treatment. Warm, home-like residences welcome students into a supporting core, from which they explore an exciting world of creativity, expression, and accomplishment, achieved with the help of our dedicated educators and health-care professionals.

Within our state-of-the-art facilities, children master skills of independent living. Our students exercise in the swimming and therapy pools, pursue knowledge using multi-media computers to access the Internet, and develop self-esteem through occupational and vocational training. Students flourish here in the brilliance of success and the joy of independence.

To find out more about the compassionate and caring services we provide for special children throughout the world, please call Debra Flanders in Admissions at 603-547-3311, ext. 235.

continued from page 84

2. Make a Medicaid buy-in available for families whose children will meet the disability determination if they do not receive the services available under Medicaid.

3. Establish Family-to-Family Health Information Centers in each of the fifty states through a competitive grant process.

The families in our survey whose child's primary plan was paid by Medicaid were more satisfied and had fewer problems than families in private health plans. The advantages of Medicaid were: the broad range of services covered under Medicaid, and fewer out-of-pocket expenses. For many parents, having a child with special healthcare needs has a significant family impact, affecting their finances, jobs, and time spent providing direct healthcare.

This bill, as it was written at press time, will help families maintain their children in their own homes and communities with the support of services offered under Medicaid. This will relieve many families who have had to make the impossible choice of placing their children in an institutional setting or placing them in foster care to make sure their child receives the services he or she needs.

Families and parent advocates should keep an eye on this bill. No doubt it will undergo some changes before it is voted on, and we need to make sure that the supports and services our children need stay intact. For a copy of the Executive Summary of the Family Partner's Survey, the Report to Families, or a packet of Fact Sheets of survey results on specific subjects, contact Nora Wells at the Family Voices office in Boston, (617) 236-7210, or E-mail: nwells@fcsn.org. **EP**

In other legislative news:

1. **Employment:** The Work Incentives Improvement Act (WIIA) is now signed into law. Now we must make sure our states implement the law. This legislation allows people with disabilities to maintain their Medicare or Medicaid coverage when they go to work. It also includes provisions that allow people with disabilities who are still working and are not yet "sufficiently disabled" to qualify for Medicaid to buy into the program. Finally, the bill reforms the training system for people with disabilities.

2. **Education:** The Educational Excellence for All Children Act (S. 1180, H. R. 1960), formerly the Elementary and Secondary Education ACT (ESEA), includes several components that will impact students in special education, including: discipline, supports and services; and equality in education.

3. **Legal:** The Hate Crimes Prevention Act of 1999 (S. 622 / H.R. 1082) will be revisited during the second session of the 106th Congress. This can help individuals with disabilities who are too often vulnerable for hate crimes. It will be important for advocates to keep an eye on this and ensure that individuals with disabilities remain protected as the bill is further developed.

Julie Keys is the National Communications/Development Coordinator for Family Voices. She is also Project Director of KASA, the Kids As Self Advocates project, a national organization of youth with special healthcare needs speaking on behalf of themselves. You can reach Julie at her office in Chicago at (312) 222-1980, or E-mail her: Julie@fvkasa.org.

COUNTERPOINT

continued from page 83

advocates and other state agencies in the monitoring process. We anticipate this will result in a greater likelihood of systemic changes which, in turn, will have a positive impact on better results for children with disabilities.

With a more collaborative overall process that encourages states to address deficiencies, we have already seen positive results. As a direct result of the new system, one state has revised its funding formula removing incentives for restrictive placements, and another state has revised its monitoring system to better ensure that services were received and rights were provided at the local level.

This administration has used the enforcement tools and sanctions at its disposal, including corrective action plans, special conditions on grants and multi-year compliance agreements. In addition, we also have the option to withhold state funds, which we exercised with the state of Virginia.

In 1997, Congress strengthened these enforcement options. As a result, we currently have ongoing discussions with the Department of Justice concerning our findings should we find it necessary to utilize the referral option for states.

The IDEA is designed to make sure that children with disabilities have an equal opportunity to meet challenging academic standards, to learn, to stay in school, to graduate and to move on to postsecondary education and the world of work.

This administration takes seriously the findings of this report and will thoroughly review its recommendations. We are always refining our methods for holding states accountable for the education of children with disabilities.

We appreciate all the work put into this product and look forward to working collaboratively with the NCD to improve the quality of education for children with disabilities across the country." **EP**

Get More Out of Vestibular Stimulation with The Motion Table

The Motion Table enables therapists to deliver the value of vestibular motion to their patients without the need for constant hands-on intervention.

Most stimulation equipment reduces the therapeutic effect of horizontal motion by allowing for undesirable rounding, swinging and tilting motion. The Motion Table eliminates that problem, however, through its smooth, motorized "vibra glide" movement. The result is steady, uniform stimulation that can help "level out" extremes in patients' behavior.

And, since The Motion Table is motorized, patients can be stimulated for longer periods than is possible with manual equipment.

The Motion Table comes in several sizes and is available from RedBarn Enterprises, a leader in innovative solutions for physical therapists and their patients.

The Motion Table reduces...
- Hypersensitivity
- Self-abuse
- Abnormal Muscle Tone
- Constipation
- Pulmonary Congestion

The Motion Table increases...
- Consentration
- Attentiveness
- Calmness
- Body Awareness
- Postural Control and Balance

Try The Motion Table AT NO RISK for 30 days.
Try it for a month. If you're not completely satisfied, just send it back for a complete refund.

For a copy of a just-released Technical Evaluation of The Motion Table or additional product information, call us at 1-800-577-1317, or visit us on the Worldwide Web at www.red-enter.com.

NATIONAL TOURETTE SYNDROME ASSOCIATION

OUR MISSION: IDENTIFY THE CAUSE, FIND THE CURE, CONTROL THE EFFECTS OF TOURETTE SYNDROME, AND SERVE EVERYONE AFFECTED.

The Tourette Syndrome Association (TSA) is a national, nonprofit voluntary health organization with over 50 chapters and over 30 support groups. Members include people with Tourette syndrome (TS), their relatives, and other interested, concerned supporters. TSA was established in 1972 when a handful of New Yorkers with family members who had TS came together to support one another and raise awareness.

As a result of TSA's medical and public education efforts, the gap between symptom onset and a diagnosis has narrowed. Today families are diagnosed more quickly than in the past, when it could take 10 years or more.

What is Tourette syndrome?

The Gilles de la Tourette syndrome is an inherited, chronic neuropsychiatric disorder—a long-term problem affecting the nerves and those parts of the brain that govern behaviors. It is characterized by the presence of tics (repeated involuntary contractions of groups of muscles) that cause unintentional movements (motor tics) and unintentional sounds (phonic tics). In addition to tics, children with TS often have a variety of behavioral or psychiatric problems.

Tourette syndrome affects between 1 and 10 out of every 10,000 people worldwide, and is three times more common in males than in females. It usually begins in childhood, often between ages 6 and 7.

TSA in action

National TSA remains the primary source of accurate and up-to-date information about TS, its treatment, relevant resources, and consumer services. TSA publishes a newsletter; maintains a crisis hotline; and produces valuable information for people with TS and their families, medical and allied professionals, educators, and legislators.

TSA also:

- offers direct help to families in crisis through its information and referral service;
- organizes workshops and symposia for scientists, clinicians, and others working in the field of TS;
- promotes public awareness and understanding;
- maintains a database of allied professionals including social workers, psychologists, nurses, educators, etc.;
- sponsors the Tourette syndrome Brain Bank Program, involving the collection of needed tissue for scientific research;
- organizes and assists local chapters and support groups throughout the US and the world;
- serves tens of thousands of members in the US and abroad;
- increases the knowledge and sensitivity to TS among healthcare professionals through exhibits, the dissemination of literature, and organization of national conferences;
- develops and maintains state-by-state lists of doctors who can diagnose and treat TS; and
- represents the interests of members to the government on critical policy issues, including orphan drugs, health insurance, education and employment.

Client services

TSA develops and disseminates educational material to individuals, professionals, and agencies working in the fields of healthcare, education, and government; coordinates support services to help people and their families cope with TS; funds research that will ultimately find the cause of and cure for TS and, at the same time, lead to improved medications and treatments.

TSA oversees a Permanent Research Fund, which provides grants for research into unlocking the mysteries of TS.

Tourette syndrome affects between 1 and 10 out of every 10,000 people worldwide, and is three times more common in males than in females. It usually begins in childhood, often between ages 6 and 7.

Membership in TSA

Membership benefits include:

- joining other families at meetings to discuss common problems and offer mutual support; and
- supporting our efforts to increase public understanding, achieve early identification, and improve treatments.

For almost a decade, TSA has kept its annual dues at $45. Families with TS who cannot afford dues need only inform us, and they will receive all the benefits of membership. Members in good standing receive a quarterly newsletter, discounts at conferences, discounts on publications, and much more. **EP**

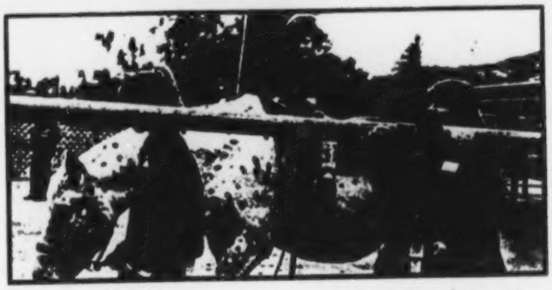
Ability Camp Inc.

Center for Conductive Education & Hyperbaric Oxygen Therapy

We are a year round facility helping children with Cerebral Palsy. Our 120 & 145hr Conductive Education programs help children learn new skills, motivate, build confidence and become more independent. We also provide Hyperbaric Oxygen Therapy as a stand alone treatment or combined with our Conductive Education programs.

For information or to receive a free video, call:
1-800-442-6992 or www.abilitycamp.com

FAMILIAR FACES



Brandon Meachare, 6, goes for a ride. Brandon has autism, and according to his mom, Kathy, he is very loving and caring toward others. He enjoys puzzles, watching Blue's Clues on TV, and riding his bike outdoors. He is mainstreamed in the first grade at Whittier Elementary School and is doing very well. Brandon and his mom live in Hemet, CA, with a pet rat, Freckles.

Gabrielle Iannizzi celebrates her sixth birthday with her dad, **Corrado,** and 3-year-old brother, **Anthony**. Gabrielle has cerebral palsy and attends United Cerebral Palsy of Brooklyn, NY. Gabrielle enjoys going to school and learning, according to her mom, Nancy. Shopping malls, going for walks, and listening to music are also among her favorite things. She always has a smile on her face. Gabrielle lives with her family in Brooklyn, NY.

Gone fishin'! **Ryan Patrick Schadt**, 5, has Angelman syndrome. He attends full-time special education classes near his home in West Peoria, IL, where he lives with his parents, Cheryl and Terry, and brother, Matthew, 6. Ryan loves water play, wrestling with his dad and brother, and playing with the two family cats. He always has a smile and a hug for everyone, according to his mom.

Would you like to share a favorite candid snapshot or slide of your child and/or family with other readers of ***Exceptional Parent?*** Send it to: Readers' Photos, *Exceptional Parent*, 555 Kinderkamack Road, Oradell, NJ 07649-1517. (Please do not send originals or "one-of-a-kinds" as we regret that **photos cannot be returned.)**

Circle #18

The Smotherman children pile into a chair! (From left to right): **Briana**, 8, **Jenna**, 6, **Brenden**, 4, and laying across them is their baby brother **Jacob**, 2, whom they adore. Jacob has spastic quadriplegic cerebral palsy, microcephaly (small head), seizures, cortical visual impairment, kidney disease, reflux, sleep apnea, and global developmental delays. Jacob, who attends Early Intervention at Heritage Elementary School, loves listening to music, swinging in his swing, and being tickled. His favorite activity is being with his parents, Rebecca and Joseph, and siblings. The family lives in Milford, MI.

Erin (left) and **Jessica Cox** are 5-year-old twins who just love to cheer for their favorite football team, BAMA! Jessica has spastic quadriplegic cerebral palsy, and she receives occupational, physical, and speech therapy at the Prattville Kindergarten Opportunity Center. She also attends regular kindergarten. Both sisters love country music, especially Travis Tritt. Jessica and Erin live with their parents, Jeff and Kay, in Prattville, AL.

Amy Lynn Regan, 9 months, is all decked out! Amy has Down syndrome and receives twice-weekly physical and occupational therapy at Early Intervention. Amy loves toys that have lights and sounds, and according to her mom and dad, Lisa and Leo, she lights up, too! Amy lives in Brockton, MA, with her parents, sister Alyssa, 14, and brothers Leo Jr., 11, and Arthur, 3.

Now on the Web! *We will now be including Familiar Faces and Children's Page on our Web site, www.eparent.com. Please send us your photographs with the understanding that doing so gives Exceptional Parent permission to put the photos on the Exceptional Parent Web site, exactly as they appear in the magazine and with the same text.*

On a separate sheet of paper, write your child's full name, age at the time the photo was taken, address and daytime phone number. Please identify everyone in the photo. If you like, you can also write a few sentences about your child. Then look for a familiar face in an upcoming issue!

Osteogenesis Imperfecta

by Priscilla Wacaster, MD

Osteogenesis imperfecta (OI) is a genetic disorder of collagen, the protein that gives strength and structure to bones and other connective tissues. The bones in people who have OI have either a weakened form of collagen or too little normal collagen. This causes their bones to fracture with little or no trauma. A person who has OI might have as few as half a dozen or as many as several hundred fractures in a lifetime. Between 20,000 and 50,000 people in the United States have OI.

Q How is OI diagnosed, and how do I know what type of OI my child has?

A OI is often diagnosed when fractures occur and a physician observes other clinical features of OI. Two laboratory tests may help confirm the diagnosis: a collagen test and a DNA test. Neither test is 100 percent accurate; some children with OI may have negative test results. The two severe types of OI are often diagnosed before birth, when ultrasound examinations reveal fractures, bone shortening, and other bone abnormalities.

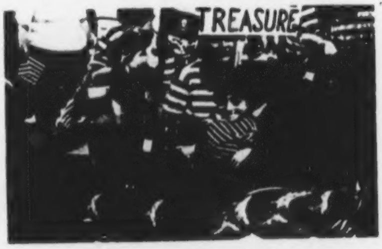
Four types of OI have been described, representing wide variation in symptoms and severity. The types are distinguished based on their clinical features; that is, stature, bone deformity, fracture frequency, and other symptoms. Because the definitions rely on subjective observations, determining the type is not always clear-cut. Some people do not fit into any of the four types, so it is possible that even more types may be defined in the future. In many cases, these diagnostic tools cannot pinpoint the type of OI the child has with 100 percent accuracy.

Type I: This is the mildest type of OI. People with this form may have only a handful of fractures throughout their lifetime. They will be normal or near-normal height and have little or no bone deformity. Children with Type I OI seldom have fractures at birth; they are often not diagnosed with OI until they have had one or more fractures in infancy or early childhood.

Type II: This is the most severe type of OI. Babies born with this type often have respiratory problems in addition to very fragile bones, and they may die at or shortly after birth.

Type III: People who have this severe form of OI have many fractures, sometimes several hundred in a lifetime. They will be very short in stature and experience other health problems caused by bone deformity. Children who have Type III OI are often born with fractures and bone deformity, and they may show evidence of fractures that occurred before birth.

Type IV: This type usually falls somewhere between Type I and Type III in severity. People who have Type IV OI are often smaller than average, have numerous fractures, and have mild to moderate bone deformity. Whereas people with the other types of OI tend to have a bluish color in the sclera (whites of the eyes), people with Type IV often have sclera that are white or near-white.



Sean Stephenson, (above) who has OI, enjoys participating in a parade.

Q Besides fragile bones, what other health problems might my child have?

A Although fragile bones are the hallmark of OI, the disorder affects the entire body. Other symptoms include: "loose" joints, low muscle tone, a tendency toward easy bruising, translucent skin, a barrel-shaped rib cage, excessive sweating, and blue sclera.

Spinal curvature (scoliosis) and rib cage deformity can lead to respiratory problems.

Many people who have OI will develop hearing loss, often beginning in their 20s and 30s, as the disease affects the bones in the ears.

Some people with OI have brittle, discolored teeth, a condition known as dentinogenesis imperfecta.

Q What can I expect for my child as he or she grows?

A Knowing the type of OI your child has can help your family understand the disorder and provide a general idea of what to expect in the future. Two people with the same type of OI, however, may have very different experiences with fractures and mobility. For example, one person with mild OI might have only four or five fractures throughout his

Ask the Doctor addresses issues of concern to our readers and is usually coordinated on a monthly basis by David Hirsch, M.D., a pediatrician and member of *Exceptional Parent's* Editorial Advisory Board. Dr. Hirsch is a partner in Phoenix Pediatrics, Ltd., in Phoenix, Arizona, and specializes in treating children who have developmental disabilities and chronic illnesses.

Parents should review any suggestions made in this column with the appropriate professionals. Mention of specific products or medications illustrate suggestions and are not endorsements of any specific products.

Send questions to: **Ask the Doctor,** *Exceptional Parent,* 555 Kinderkamack Road, Oradell, NJ 07649-1517, or fax, (201) 634-6570.

or her lifetime and participate in sports with no ill effects, while someone else might have several dozen fractures and walk with crutches. One person with severe OI may use a walker, while someone else may use a wheelchair. The number of fractures and the need for surgery also vary widely, even among people with the same type of OI.

Rather than focusing on the type of OI, it is more useful to base future expectations on your child's abilities, strengths, and weaknesses. Your child's physician, physical therapist, and the other professionals on your healthcare and educational teams can work with your family to help your child function to the best of his or her ability. It is reasonable to expect children who have OI to become independent in all major life functions (self-care, locomotion, recreation, social interaction, and education) with the help of adaptive equipment, as needed. OI does not affect intellectual, mental, or emotional health. People who have OI can succeed in school, work, family, and social environments.

Life expectancy for people who have OI has not been clearly defined. In general, life expectancy for people with mild and moderate OI is average. Babies who have the most severe type of OI (Type II) may die before or during birth, in infancy, or in childhood, although some people who have Type II have survived into young adulthood. Life expectancy for people with Type III OI is affected by the severity of spine and chest deformities. Individuals may live into old age or succumb to respiratory infection in middle adulthood.

Q Is there anything we can do to prevent fractures?

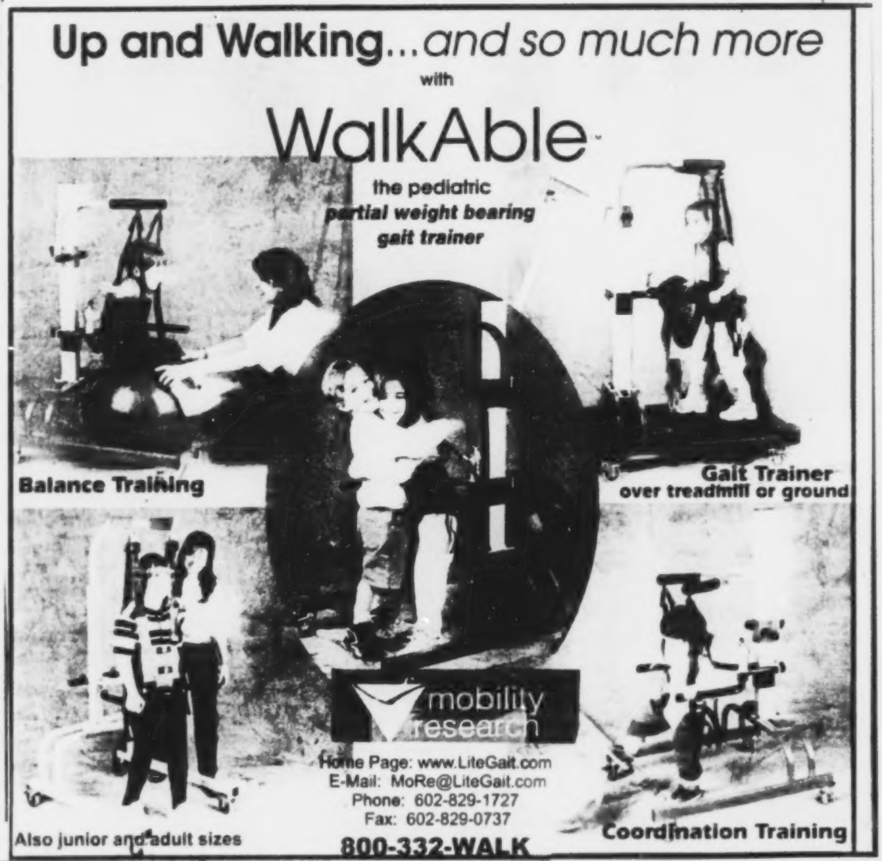
A Fractures will happen no matter how careful you and your child are; they are simply a fact of life with OI. Fractures are often unpredictable. One day your toddler might fall down without injury, while the next day his or her leg might fracture during a diaper change. While some caution is called for, it is still important for your child to move, play, and interact with others as much as possible.

Babies who have OI should be handled gently. Pick the baby up with one hand firmly supporting the neck and head, and the other hand supporting the back, buttocks and legs. Be aware of the positioning of the arms and legs to avoid getting them caught in an awkward position. If your baby has severe OI, it may be helpful to use a pillow or foam pad to carry him or her. When changing a diaper, lift under the baby's buttocks rather than pulling on his or her ankles. A video and booklet describing how to care for infants and young children who have OI are available from the OI Foundation.

Kelly Petrolelle and Nicole Hofhine smile for the camera. Between 20,000 and 50,000 people in the United States have OI.

As your child grows, you will both learn what types of play and movement are safest. It is natural for your child to test his or her limits and abilities, and sometimes a fracture will occur as a result. Most people with OI say that they would rather experience life and experi-

continued on page 96



Circle #56

BEST COPY AVAILABLE

continued from page 95

ment with their abilities, and thus risk fractures, than "sit on the sidelines." Active play and exercise may even help prevent fractures, because stronger muscles lead to stronger bones.

Q What type of doctor can provide the best care for my child?

A The OI Foundation maintains a physician referral database and may be able to refer you to a physician with experience treating OI. Because OI is a rare disorder, however, there may not be an experienced doctor in your area. In that case, a board-certified, knowledgeable, and compassionate pediatric orthopedist (a doctor who specializes in children's bones) is your best option. Your pediatrician or other families affected by OI may be able to recommend someone. The OI Foundation can provide you and your physician with the latest information on OI and refer your physician to OI experts for peer consultation.

Your child will also need to see a pediatrician regularly for immunizations and other routine care. You and your child may need to consult other medical professionals, such as a physical therapist or an ENT (ear, nose, and throat) specialist for hearing loss as the need arises.

Q How will OI affect my child's education?

A OI does not affect intellectual ability, and many children with OI excel in school. Under the federal Individuals with Disabilities Education Act (IDEA), all eligible school-aged children and youths with disabilities are entitled to receive a free appropriate public education in the least restrictive environment. By participating in all school activities with their peers, children with OI can experience both the intellectual challenge and social interaction they need to become successful adults.

Children with OI may need special accommodations or assistance to allow them to fully participate in school, and in many cases, public schools are required by law to provide this assistance. In addition to an assessment of architectural barriers, the need for adapted physical education, physical and occupational therapies, personal aides, assistive devices, and transportation should be considered. School personnel should be trained to deal with fractures or other medical emergencies that may occur at school.

These issues are best addressed by a team of people involved in the child's education, including parents,

teachers, adapted physical education specialists, special education specialists, therapists, the school nurse, and, when appropriate, the child. By developing an Individual Education Plan (IEP), this team can plan for the student's success in all areas of education. A video and booklet showing how to integrate children into school activities, including physical education classes, are available from the OI Foundation.

Q How is OI treated?

A OI is treated primarily by managing fractures and promoting independence and mobility. Prolonged immobility can lead to muscle loss, weakness, and more fractures. Many orthopedists prefer to treat fractures with short-term immobilization in lightweight casts, splints, or braces to allow some movement as soon as possible after the fracture.

Many children who have OI undergo a surgical procedure known as "rodding," in which metal rods are inserted into the long bones to control fractures and improve deformities that interfere with function.

Physical therapy is appropriate for infants and children who have muscle weakness or motor skill delay when compared with same-age peers. Occupational therapy can help your child develop age-appropriate, fine motor skills and identify adaptive equipment that will allow your child as much independence as possible in daily living.

As a child with OI grows older, he or she will benefit from continued physical activity, such as adapted physical education and safe exercise. Swimming and aquatic therapy are particularly well suited for people with OI.

Various minerals and medications have been tested to determine if they strengthen bone in people with OI. Unfortunately, most of these substances have not been proven effective. Current research is investigating whether the bisphosphonate drugs, which are currently approved for use in postmenopausal osteoporosis, will also be effective in treating OI. They are showing some promise, but the final results are not available. There are a number of ongoing clinical trials of bisphosphonates that your child may be eligible for. Before enrolling your child in any clinical trial, it is vital to get information on the risks involved. The OI Foundation can provide information to guide you as you decide whether to involve your child in experimental procedures.

Q If we have more children, what is the risk that they will

also have OI?

A OI is caused by a dominant genetic mutation. Most children with OI inherit the disorder from a parent. If you or your spouse has OI, there is a 50 percent chance with each pregnancy that the child will have OI. An affected child will have the same mutation, and therefore the same type of OI, as his or her parent. The disorder may not affect the child in exactly the same way it has affected the parent, however.

Approximately 25 percent of children with OI are born into families with no history of the disorder. This is usually due to a spontaneous dominant mutation that takes place in the sperm or egg prior to conception. In most of these cases, the risk that the parents will have another child who has OI is the same as for the general population (i.e., the risk is very small). Occasionally, a parent may be mosaic for a mutation; that is, a mutation that causes OI is present in a percentage of the parent's reproductive cells. In these cases, there is a slightly higher risk (2 to 4 percent) of having more than one child who has OI. Unaffected siblings of a child with OI are at no greater risk of having children with OI than the general population.

Q Will there be a cure for OI?

A Researchers are exploring gene and cell therapies that correct the genetic defect that causes OI. These therapies are still being studied and perfected in laboratory animals.

Q Where can I get the latest information on OI?

A The Osteogenesis Imperfecta (OI) Foundation is a national non-profit organization that can provide information on these topics and many others. The OI Foundation publishes fact sheets, brochures, videos, audiotapes, and books for people who have OI, their families, and medical professionals. In addition, the OI Foundation has staff and volunteers available to provide individualized responses to your specific questions. The organization can also link you with other families and individuals living with OI through support groups, online chat rooms, and national conferences. To contact the OI Foundation call (800) 981-2663; E-mail: bonelink@oif.org; or visit their Web site: www.oif.org. **EP**

Priscilla Wacaster, MD, is a family practice physician. She and her two children, ages 8 and 2, have Type I OI. Dr. Wacaster is a member of the Medical Advisory Council for the OI Foundation.

Exceptional children deserve exceptional care.

The best help for cerebral palsy, spina bifida and related disorders is at Kennedy Krieger Institute.

For 61 years, Kennedy Krieger Institute has been the leader in helping children with severe disabilities. Focusing on early identification, intervention and treatment, our state-of-the-art interdisciplinary team approach—combined with a caring, supportive touch—has enabled generations of children to live their lives to the fullest.

Our comprehensive assessment and treatment for children with cerebral palsy, spina bifida and related disorders includes: Neurology, Medical Services, Nursing, Urology, Orthopedics, Physical Therapy, Occupational Therapy, Orthotist, Clinical Psychology, Neuro-Psychology, Seating, Feeding, as well as Rhizotomy, Spasticity and Movement Disorder clinics.

And unlike many programs, we see patients beyond age 18. Call Kennedy Krieger Institute today. We're here to help.

Moving Right Along

Take a few virtual stops at these Web sites for information on mobility.

by Vanessa B. Ira

One of the most notable contributions of the Internet is how it has made travel much less stressful. Resources on the topics of travel and mobility, easily accessible from one's desktop, are plentiful and available from nonprofit and commercial sources. Families that have children or young adults with special needs can begin exploring such resources through the following Web sites:

Abledata.com (http://www.abledata.com/text2/whl_chil.htm) Abledata, a federally funded project, provides "information on assistive technology and rehabilitation equipment available from domestic and international sources to consumers, organizations, professionals and caregivers within the United States." Its Web site includes an invaluable and detailed source of information under the section called "Wheelchairs for Children." Sub-topics in the section include: Considerations in Wheelchair Selection; Wheelchair Components; Types of Wheelchairs and Wheelchair Alternatives; Funding Sources; Companies.

Rehabcentral.com (http://www.rehabcentral.com/communityhome.cfm) This site provides the resources you need to find rehabilitation products and assistive devices. Relevant sections here include the following: Message Boards; Bookstore; Supplier Directory; and Articles & Case Studies. Recent articles from the site's archives section include: "Kathleen's First Wheelchair" by Adrienne Falk Bergen, PT, ATP/S CRTS, and "Interfacing Assistive Technology with Power Wheelchairs–Part 3" by Michelle L. Lange, OTR, ABDA, ATP.

Web portals: Nearly all the commercial Web portals will have a central "Travel" link that you can explore further for special needs topics. If you are looking for quick results, you can also make use of these site's search engines by typing pertinent keywords such as "travel + disability." Any one of the following portals can be a good starting point for your research on topics pertaining to travel and mobility: Yahoo! (http://www.yahoo.com); AOL (http://www.aol.com); Lycos (http://www.lycos.com); MSN (http://www.msn.com) or AltaVista (http://www.altavista.com). **EP**

E-mail your comments on this article, or other ideas or suggestions for EParent.com, to: Vanessa B. Ira, Internet Projects Advisor and Consultant, at: vira@eparent.com. Or call (201) 634-6550 ext. 213.

Cast Your Vote!

This September, Exceptional Parent's 28th Annual Education Issue Will Recognize:

MODELS OF EXCELLENCE IN EDUCATION

Awards for both Inclusive Education AND Specialized Programs

ALL GRADES: Pre-School THROUGH High School

Send us 600 words or less about specific educational programs that you think make school "cool" for children with disabilities and special needs.

Here are some areas where exceptional programs stand out:

- Inclusion.
- Parents' active involvement.
- Bringing the community into the classroom and the classroom into the community.
- How the school has put its philosophy into action.
- Ease of duplication of program(s).

And don't forget the pictures, pictures, pictures! There's always the chance that your photos will make a great shot for September's cover!

DEADLINE: JULY 1, 2000

Send nominations to: **Education Awards**

Exceptional Parent Magazine, 555 Kinderkamack Rd., Oradell, NJ 07649-1517

Don't think you're a hero?

He does.

When you participate in March of Dimes WalkAmerica, you really are a hero. That's because you're helping to save innocent babies born sick through no fault of their own. These babies are vulnerable and defenseless; their lives may hang in the balance. By joining WalkAmerica, you could make a difference for them.

Contact the March of Dimes today by visiting www.modimes.org or call:

Will You Hold My Hand?

By Amanda Eckel

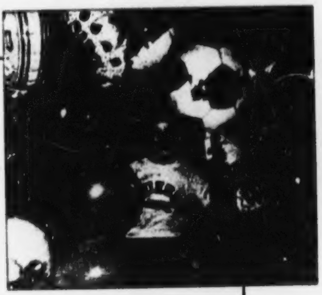
My brother's name is Joc French. He is 6 years old and is in the first grade. Joc is a very bright child. He was diagnosed with mild spastic cerebral palsy (CP) at the age of 1. Each morning he wakes up knowing he has a long day ahead of him, with school and therapy five days a week.

His big brown eyes are always full of hope and you will never hear him complain. Independence is very important to him. If I try to help him with a new task he quickly lets me know that he can do it.

This little trouper has been through many surgeries. His latest one was in January 1999, a dorsal rhizotomy (a procedure performed on the lower portion of the spinal cord to diminish tone in spastic muscles of the lower limbs). I held his hand and gave him my prayers every step of the way. Sometimes I think these things may be harder on the family than on him. He is a strong little guy, full of determination and well-deserved pride.

Joc and I were on our way home the other day, and he asked me a question. He said "Sis, if God loves me so much then why did he give me CP?" With tears in my eyes, I replied, "Sweetie, God loves you so much, and he knew you were a strong little guy, so..." I was speechless. For the first time, I had no answer for him. I do not understand why things happen—nobody does. I do know that my family and I have been blessed with an angel. Joc is the best gift God could ever have given me. He has taught me about dedication as well as determination. Most of all, my brother has shown me what a gift every moment of life is. Thank you, Joc, for being my guide. **EP**

Amanda Eckel and her little brother Joc French.



Joc gets a warm welcome home after his surgery.

The family on Christmas day. Back row, l-r: Mike, Mark (Joc's dad), and Clay. Front row, Amanda, Joc, and Tammy.

Mom's turn

I was looking for something on our computer when I came across a file titled "Will you hold my hand?" When I opened it, I found this paper my daughter Amanda had written about Joc. I was so touched. When I asked Amanda about it, she told me she had gotten a school writing assignment. She chose to write about cerebral palsy and Joc.

We are thankful every day for all of our children. They are all very special. Amanda was 10 years old when Joc was born, and I am sure at times she felt left out when he was getting so much attention. Amanda is now 18 years old and is a very lovely young lady. Joc also has two older brothers, my husband's sons Michael, 24, and Clay, 19. Our whole family has learned a lot since Joc was born. We have learned patience, dedication, and what family unity is all about.

Joc is now 7 years old and attends the second grade. He enjoys playing the piano, horseback riding, swimming, camping, and riding his four-wheeler. He has physical therapy three times a week, and occupational therapy once a week. He is improving all the time.

Amanda lives in Lovington IL, with Joc, her mom, Tammy French, and stepfather, Mark French.

Now on the Web! *We will now be including Familiar Faces and Children's Page on our Web site, www.eparent.com. Please send us your photographs with the understanding that doing so gives Exceptional Parent permission to put the photos on the Exceptional Parent Web site, exactly as they appear in the magazine.*

The Children's Page welcomes contributions from children who have disabilities, their siblings, and their friends. Be creative! **Send your stories, photos and/or artwork** to: **Children's Page,** *Exceptional Parent,* 555 Kinderkamack Road, Oradell, NJ 07649-1517. **Be sure to include your name, address, and day-time telephone number!**

In a Vail Enclosed Bed

Now every special-needs child can enjoy the soft, non-threatening security of an enclosed hospital bed -- while you enjoy peace of mind knowing that they are softly protected during the night.
Vail Enclosed Beds offer the protection of a soft, sturdy enclosure for:

- Fewer falls and injuries.
- Reduced wandering.
- More relaxed sleep—for your child *and* for you.

For convenience, Vail Enclosed Beds also accommodate medical equipment, fit all ages from child to adult, are frequently covered by insurance, and come complete with mattress, manually adjustable hospital bed, lifetime service, assembly video and vinyl border and bedskirt. Patterned fabric Decorator Accessories are also available at an additional cost.

Available from home health-care products dealers, or direct from the manufacturer.

FOLLOW THE GOOD LIFE – WHEREVER IT LEADS!

Carnitine deficiency may affect as many as 375,000 children in the U.S. Unfortunately, it's hard to detect and often overlooked.

Carnitine plays a vital role in the production of energy. And when a child suffers from carnitine deficiency, he or she may have symptoms as subtle as developmental delay, frequent illness, poor muscle tone or slow weight gain. If Carnitor® can help your child, results may be dramatic.

Carnitor® is the only treatment for carnitine deficiency.

So ask your child's doctor about Carnitor® and contact us for more information at 1-800-447-0169.

levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

Adverse events reported with Carnitor use include nausea, vomiting, body odor, gastritis, and seizures. There are no reported contraindications or warnings.

Please refer to the attached brief summary of prescribing information.

Carnitor®
levocarnitine

Tablets 330mg • Oral Solution 1g/10mL

CARNITOR® (levocarnitine) Tablets (330 mg)
CARNITOR® (levocarnitine) Oral Solution (1 g/10 mL multidose)
FOR ORAL USE ONLY. Not for parenteral use. Rx only.

BRIEF SUMMARY
The following is a brief summary. Please see package insert for full prescribing information.

CLINICAL PHARMACOLOGY
CARNITOR® (levocarnitine) is a naturally occurring substance required in mammalian energy metabolism. It has been shown to facilitate long-chain fatty acid entry into cellular mitochondria, therefore delivering substrate for oxidation and subsequent energy production. Fatty acids are utilized as an energy substrate in all tissues except the brain. In skeletal and cardiac muscle they serve as major fuel. Primary systemic carnitine deficiency is characterized by low plasma, RBC, and/or tissue levels. It has not been possible to determine which symptoms are due to carnitine deficiency and which are due to the underlying organic acidemia, as symptoms of both abnormalities may be expected to improve with carnitine. The literature reports that carnitine can promote the excretion of excess organic or fatty acids in patients with defects in fatty acid metabolism and/or specific organic acidopathies that bioaccumulate acyl CoA esters.

Secondary levocarnitine deficiency can be a consequence of inborn errors of metabolism. CARNITOR® may alleviate the metabolic abnormalities of patients with inborn errors that result in accumulation of toxic organic acids. Conditions for which this effect was demonstrated are: glutaric aciduria II, methyl malonic aciduria, propionic acidemia, and medium chain fatty acyl CoA dehydrogenase deficiency. Autointoxication occurs in these patients due to the accumulations of acyl CoA compounds that disrupt intermediary metabolism. The subsequent hydrolysis of the acyl CoA compound to its free acid results in acidosis that can be life threatening. Levocarnitine clears the acyl CoA compound by formation of acyl carnitine which is quickly excreted.

Levocarnitine deficiency is defined biochemically as abnormally low plasma levels of free carnitine, (less than 20 μmol/L at one week post term) and may be associated with low tissue and/or urine levels. Further, this condition may be associated with a ratio of plasma ester/free levocarnitine levels greater than 0.4 or abnormally elevated levels of esterified levocarnitine in the urine. In premature infants and newborns, secondary deficiency is defined as plasma free levocarnitine levels below age related normal levels.

BIOAVAILABILITY/PHARMACOKINETICS
In a relative bioavailability study in 15 healthy adult male volunteers CARNITOR® Tablets were found to be bio-equivalent to CARNITOR® Oral Solution. Following the administration of 1980 mg b.i.d., the maximum plasma concentration level (C_{max}) was 80 nmol/mL and the time to maximum concentration (T_{max}) occurred at 3.3 hours. There were no significant differences for AUC and urinary excretion observed between these two formulations.

In the same bioavailability study of 15 healthy adult males, CARNITOR® (levocarnitine) Injection administered as a slow 3 minute bolus intravenous injection at a dose of 20 mg/kg showed that free levocarnitine plasma profiles are best fit by a two compartment model. Approximately 76% of free levocarnitine is eliminated in the urine. Using plasma levels uncorrected for endogenous levocarnitine, the mean distribution half life was 0.585 hours and the mean apparent terminal elimination half life was 17.4 hours following a single intravenous dose.

The absolute bioavailability of L-carnitine from CARNITOR® Tablets and Oral Solution was determined compared to the bioavailability of L-carnitine from CARNITOR® Injection Intravenous in 15 healthy male volunteers. After correction for circulating endogenous levels of L-carnitine in the plasma, absolute bioavailability was 15.1% ± 5.3% for L-carnitine from CARNITOR® Tablets and 15.9% ± 4.9% from the Oral Solution.

Total body clearance of L-carnitine (Dose/AUC including endogenous baseline levels) was a mean of 4.00 L/hr. Endogenous baseline levels were not subtracted since total body clearance of L-carnitine does not distinguish between exogenous sources of L-carnitine and endogenously synthesized L-carnitine. Volume of distribution of the intravenously administered dose above baseline endogenous levels was calculated to be a mean of 29.0 L ± 7.1 L (approximately 0.39 L/kg) which is an underestimate of the true volume of distribution since plasma L-carnitine is known to equilibrate slowly with, for instance, muscle L-carnitine.

L-carnitine was not bound to plasma protein or albumin when tested at any concentration or with any species including the human.

INDICATIONS AND USAGE
CARNITOR® (levocarnitine) is indicated in the treatment of primary systemic carnitine deficiency. In the reported cases, the clinical presentation consisted of recurrent episodes of Reye-like encephalopathy, hypoketotic hypoglycemia, and/or cardiomyopathy. Associated symptoms included hypotonia, muscle weakness and failure to thrive. A diagnosis of primary carnitine deficiency requires that serum, red cell and/or tissue carnitine levels be low and that the patient does not have a primary defect in fatty acid or organic acid oxidation (see Clinical Pharmacology). In some patients, particularly those presenting with cardiomyopathy, carnitine supplementation rapidly alleviated signs and symptoms. Treatment should include, in addition to carnitine, supportive and other therapy as indicated by the condition of the patient.

CARNITOR® (levocarnitine) is also indicated for acute and chronic treatment of patients with an inborn error of metabolism that results in a secondary carnitine deficiency.

CONTRAINDICATIONS
None known.

WARNINGS
None.

PRECAUTIONS
General
CARNITOR® (levocarnitine) Oral Solution is for oral/internal use only.
Not for parenteral use.
Gastrointestinal reactions may result from too rapid consumption of carnitine. CARNITOR® (levocarnitine) Oral Solution may be consumed alone, or dissolved in drinks or other liquid foods to reduce taste fatigue. It should be consumed slowly and doses should be spaced evenly throughout the day to maximize tolerance.

Carcinogenesis, mutagenesis, impairment of fertility
Mutagenicity tests performed in *Salmonella typhimurium*, *Saccharomyces cerevisiae*, and *Schizosaccharomyces pombe* indicate that CARNITOR® (levocarnitine) is not mutagenic. Long-term animal studies have not been conducted to evaluate the carcinogenicity of the compound.

PREGNANCY
Pregnancy Category B.
Reproductive studies have been performed in rats and rabbits at doses up to 3.8 times the human dose on the basis of surface area and have revealed no evidence of impaired fertility or harm to the fetus due to CARNITOR®. There are, however, no adequate and well controlled studies in pregnant women. Because animal reproduction studies are not always predictive of human response, this drug should be used during pregnancy only if clearly needed.

NURSING MOTHERS
It is not known whether this drug is excreted in human milk. Because many drugs are excreted in human milk, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

PEDIATRIC USE
See Dosage and Administration.

ADVERSE REACTIONS
Various mild gastrointestinal complaints have been reported during the long-term administration of oral L- or D,L-carnitine; these include transient nausea and vomiting, abdominal cramps, and diarrhea. Mild myasthenia has been described only in uremic patients receiving D,L-carnitine. Gastrointestinal adverse reactions with CARNITOR® (levocarnitine) Oral Solution dissolved in liquids might be avoided by a slow consumption of the solution or by a greater dilution. Decreasing the dosage often diminishes or eliminates drug-related patient body odor or gastrointestinal symptoms when present. Tolerance should be monitored very closely during the first week of administration, and after any dosage increases.

Seizures have been reported to occur in patients with or without pre-existing seizure activity receiving either oral or intravenous levocarnitine. In patients with pre-existing seizure activity, an increase in seizure frequency and/or severity has been reported.

OVERDOSAGE
There have been no reports of toxicity from carnitine overdosage. The oral LD_{50} of levocarnitine in mice is 19.2 g/kg. Carnitine may cause diarrhea. Overdosage should be treated with supportive care.

DOSAGE AND ADMINISTRATION
CARNITOR® (levocarnitine) Tablets.

Adults: The recommended oral dosage for adults is 990 mg two or three times a day using the 330 mg tablets, depending on clinical response.

Infants and children: The recommended oral dosage for infants and children is between 50 and 100 mg/kg/day in divided doses, with a maximum of 3 g/day. Dosage should begin at 50 mg/kg/day. The exact dosage will depend on clinical response.

Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution.
For oral use only. **Not for parenteral use.**

Adults: The recommended dosage of levocarnitine is 1 to 3 g/day for a 50 kg subject, which is equivalent to 10 to 30 mL/day of CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 1 g/day, (10 mL/day), and be increased slowly while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

Infants and children: The recommended dosage of levocarnitine is 50 to 100 mg/kg/day which is equivalent to 0.5 mL/kg/day CARNITOR® (levocarnitine) Oral Solution. Higher doses should be administered only with caution and only where clinical and biochemical considerations make it seem likely that higher doses will be of benefit. Dosage should start at 50 mg/kg/day, and be increased slowly to a maximum of 3 g/day (30 mL/day) while assessing tolerance and therapeutic response. Monitoring should include periodic blood chemistries, vital signs, plasma carnitine concentrations, and overall clinical condition.

CARNITOR® (levocarnitine) Oral Solution may be consumed alone or dissolved in drink or other liquid food. Doses should be spaced evenly throughout the day (every three or four hours) preferably during or following meals and should be consumed slowly in order to maximize tolerance.

All children should be seen. And heard.

With free Bell Atlantic assistive equipment, the lines of communication are open to children with disabilities.

If you're the parent of a child with a disability, you know that talking on the phone is just as important to him as it is to every other child. Which is why, if your child qualifies, you should apply for free assistive equipment from Bell Atlantic. To qualify, your child must be under 18 and have a certified disability that hinders him (or her) from using the phone, and receive SSI disability benefits.

The equipment covers the range from TTYs and volume-amplified telephones to light signalers, loud tone ringers, and large-number and hands-free telephones.

As you already know, every child has something to say. Now yours can say it on the phone much easier than before. **For recorded information about the program or to request an application, call 1 800 882-6828 (V) 1 800 299-2640 (TTY)**

This is a limited time offer and applies only to New York State Bell Atlantic customers or their dependents living in the same household, for as long as our supply of this equipment lasts.

EXCEPTIONAL PARENT
Parenting your child or young adult with a disability or special healthcare needs

Independence means different things to different people. For children with bladder or bowel control problems, it could just mean getting through the day dry. That's why something as simple as a change in clothing, can, even in a small way, change a child's way of life.

WHY CHILDREN WHO RELY ON GOODNITES ARE MORE INDEPENDENT.

GoodNites® absorbent underpants can help a child become more independent. With GoodNites, accidents won't become catastrophes. So your child will be able to do more. Plus, because they look like real underwear, kids don't mind wearing them. And since they're easy to pull on and off, they can make a child feel more self-reliant.

GoodNites are available in 3 sizes: 45–65 lbs., 65–85 lbs., and 85–125 lbs. That means finding the size that fits your child will no longer be a problem. Plus they have tear-away sides and they're latex-free.

- *Day and nighttime protection*
- *Latex-free*
- *Tear-away sides for easy removal*
- *Three sizes, to fit kids from 45–125 lbs.*

Imagine your child gaining a little more independence just by a change in clothing. For information on how GoodNites can help, and a free sample offer, please visit us at www.goodnites.com/offer

EDITOR'S DESK

Swing Into Spring

It is appropriate that our May issue is dedicated to sports, recreation, and play since spring is the time of new growth and the longer days inspire all kinds of activity. Participation in recreational activities is important for the growth and development of all children. They provide opportunities to be included, make new friends, and learn the social skills needed to be part of a group, such as taking turns and playing by the rules. Through recreational activities, children can also learn about themselves and their bodies, laying a foundation for life-long fitness.

School provides a place where recreational skills are learned. Physical education is meant to address current and lifetime fitness needs of a child, and also acts to promote educational and social development. IDEA (the Individuals with Disabilities Education Act) has long required that a physical education assessment be part of the IEP (Individualized Education Plan), and if necessary, that an adapted physical education (adapted PE) program be provided. Generally, parents do not know what to expect from this assessment. Under the heading "Let's Get Physical," we present three articles discussing the aspects of adapted PE: Rebecca Lytle discusses some easy-to-duplicate adapted PE activities, as well as what an adapted PE program is and how to advocate for it; Michael Aitken, who teaches adapted PE on the high school level, describes how adolescents with disabilities can reap social and self-esteem benefits; John Passarini, a teacher of adapted PE, shares with EP's Gale Jurasek his successful methods for inclusion, he also outlines an IEP for adapted physical education.

John was recently honored as the Adapted Physical Education National Teacher of the Year by the American Association for Active Lifestyles and Fitness/Adapted Physical Activity Council for his pioneering efforts in providing access to participation in everyday recreation and games for all children. We are pleased to recognize him this month as an "Exceptional Professional." His innovative techniques to integrate all children into creative games and activities in the school setting and beyond have served to benefit all his students in a multitude of ways.

To set a foundation for life-long physical fitness, the role of the family in teaching the skills necessary for play and recreation is critical. Parents are often unsure how to include the child with a disability. "Wet 'n Wild" by Ryan Mayo of the National Sports Center for the Disabled this month offers rafting as one solution. In addition, Special Olympics International has provided stretching and relaxation exercises that are useful alone or as the first step in preparing for organized sports. In the coming months, we will continue to present more exercises and activities from Special Olympics that can be done at home or at school.

Plan to join us May 28-31, 2000 for Humanizing Health Care for Children and Families: The Art of the Relationship, a conference and exhibit hosted by the MassGeneral Hospital for Children in collaboration with EP. Among the topics to be discussed are: family centered care, community/school integration, spiritual care and emotional support. For more information on the event which will take place in Boston, contact Mary Lou Kelleher at MassGeneral at (617) 724-5720.

This November 10-12, EP will co-sponsor The World Congress & Exposition on Disabilities (WCD) in Atlanta, Georgia. We invite individuals with disabilities, families and professionals to take advantage of this opportunity to come together to share their knowledge and experience. For more information, contact the WCD at (877) 923-3976, or (201) 226-1446; Web site: http://www.wcdexpo.com.

Spring is also the time when we turn our attention to the national pastime: baseball. The Challenger League was developed to give youngsters with special needs a "league of their own." Kerry Pianoforte describes the Oradell, New Jersey, Challenger League and how to start a program in your town.

Peggi McNairn and Cindy Schioleno end their excellent series on augmentative and alternative communication, "Can We Talk?" In this concluding installment, individuals who are successful users of AAC devices share their thoughts so that parents, professionals, and other AAC users can learn from their experiences.

EP employee honored

We are proud to announce that one of our staff members here at EP has received a prestigious award. Dennis Dusevic has been recognized for outstanding success in employment by the New Jersey chapter of APSE (Association of Persons in Supported Employment), a national organization dedicated to fostering employment opportunities for people with disabilities. As a co-worker and employee, he has set a great example. Congratulations, Dennis!

Welcome

We are proud to welcome two new members to our Editorial Advisory Board: Lawrence T. Taft, MD, is a professor of pediatrics at the University of Medicine and Dentistry of New Jersey, Robert Wood Johnson Medical School. He has also served as editor-in-chief for our special report, "Positive Perspectives for Cerebral Palsy."

Chris Feudtner, MD, PhD, is a pediatrician at the Pediatric Care Center of the University of Washington, Seattle, and is currently a Robert Wood Johnson Clinical Scholar. A past contributor to our Ask the Doctor column, Dr. Feudtner currently reviews EP's Search and Respond column.

Cast your vote!

Remember to send in your nomination for our Models of Excellence in Education. We are interested in both inclusive and specialized educational programs, pre-school through high school, that have helped young people with disabilities succeed in learning. Send your nominations to:

Education Awards, Exceptional Parent Magazine, 555 Kinderkamack Rd., Oradell, NJ 07649-1517.

Maxwell J. Schleifer, PhD
Editor-in-Chief

NEW IMPROVED
QUICK-MIX FORMULA
DISSOLVES INSTANTLY, NO LUMPING.

To Life!

DIAFOODS THICK-IT brings the joy of eating back to people with swallowing problems.

Here's the solution for the millions of young and old who need modified consistencies to enjoy eating.

DIAFOODS THICK-IT, when mixed with hot or cold, thick or thin liquids and pureed foods, produces any desired consistency quickly, easily and controllably. But it does not change the taste or appearance of the food it thickens.

DIAFOODS THICK-IT adds sixteen calories per tablespoon for nourishment but is very low in sodium for people on sodium-restricted diets. And it helps hydrate patients because it will not bind water or fluids.

DIAFOODS THICK-IT is the market-maker and the #1 selling brand of Instant Food Thickener. It is recommended by speech and language pathologists, dietitians and nutritionists in hospitals, nursing homes and rehabilitation facilities across the country.

For product literature and advice, a free sample and information where **DIAFOODS THICK-IT** may be purchased, call... (800) 333-0003.

Free educational material, call... (800) 333-0003.

The booklet **"Dysphagia, A Review For Health Professionals"** discusses causes, evaluation and treatment of dysphagia.

The pamphlet **"Swallowing Problems"** helps patients and caregivers understand and adapt to dysphagia.
